Infant's chest radiograph is said to be non-accidental injury. Infant examination recognised, crepitus had been noted by the mother. Fractures were diagnosed from the chest radiograph. The infant was weaning breast milk. However, there were no signs of other fractures. The finding of rib fractures on an infant's chest radiograph is said to be highly specific for non-accidental injury (NAI). Fractures may also occur during birth and, if this is not recognised, NAI may be incorrectly diagnosed.

Infant birth trauma—birth trauma or non-accidental injury

Sir,—The finding of rib fractures on an infant’s chest radiograph is said to be highly specific for non-accidental injury (NAI). Fractures may also occur during birth and, if this is not recognised, NAI may be incorrectly diagnosed.
