Abstract 356 Figure 1  Study design

At postnatal day 2, infants received a primed continuous infusion of $[^{13}C, ^{15}N]$leucine. Mass spectrometry was used to determine the fractional and absolute albumin synthesis rates (FSR and ASR, respectively).

**Results** Albumin FSR, concentration, and ASR were not significantly different between groups (Figure 2; median, IQR).

**Conclusion** Albumin concentration was in normal range in all groups. Albumin synthesis rates and concentration are not increased upon introduction of 2 g lipids/(kg.d) and 3.6g AA/(kg.d) from birth onwards.

---

**Abstract 357 Figure 1  Human milk BSSL at different study points**

**Conclusion** The increased levels of human milk BSSL could compensate for low endogenous capacity to digest dietary fat in early life as efficient absorption of lipids is important, not only for energy utilization but also for optimal growth and functional neurodevelopment.

**THE EFFECT OF GALACTOGOGUE HERBAL TEA ON OXIDANT AND ANTI-OXIDANT STATUS OF HUMAN MILK**

doi:10.1136/archdischild-2012-302724.0358

S Kavurt, AV Bas, O Aydemir, H Yücel, N Demirel. Neonatology, Etlik Zübeyde Hanım Women’s Health Teaching and Research Hospital, Ankara, Turkey

**Background and Aims** Human milk (HM) has a number of anti-oxidant constituents which may protect newborns against oxidative damage. Poor HM production is the most frequent cause of breastfeeding failure. Galactagogues are believed to stimulate initiation and maintenance of HM production. Herbal tea containing fenugreek has recently been presented in the market. We aimed to compare global oxidant and antioxidant capacity of HM among mothers drinking galactagogue herbal tea or not.

**Methods** Volunteer mothers 18–35 years of age without any ante-natal or perinatal risk factors. Milk samples were collected in the first day after delivery. Mothers were randomly assigned to receive galactagogue herbal tea (Humana still-tee®) 3 cups/day or same amount of water as placebo. Second samples were obtained 7–10 days later. The total oxidant and antioxidant capacity of HM was measured using spectrophotometry.

**Results** Subjects were randomly assigned to herbal tea (n=40) and placebo (n=40) groups. In first and second samples TAC, TOS and OSI were similar between groups. OSI (p=0.024 and p=0.007) increased significantly compared to first day in each group.

**Conclusions** Galactagogue herbal tea used in this study has no effect on global oxidant and antioxidant status of HM. Oxidative stress index increases in course of lactation compared to colostrum.

**INTRASUBJECT VARIATION IN ESTIMATES OF NEONATAL INTRAHEPATIC CELLULAR LIPID USING 1H NMR SPECTROSCOPY**

doi:10.1136/archdischild-2012-302724.0359

1P Piemontese, 1P Roncada, 1A Soggiu, 1L Bonizzi, 1C Agostoni, 1M Giannì, 1P Roggero, 1F Mosca. 1Department of Maternal and Pediatric Sciences, NICU Fondazione IRCCS ‘Ca’ Granda’ Ospedale Maggiore Policlinico, University of Milan; 1Istituto Sperimentale Italiano Lazzaro Spallanzani; 1IPAV, University of Milan; 1Heinz Italia Spa; 1Institute of Pediatrics, University of Milan, Fondazione IRCCS ‘Ca’ Granda’ Ospedale Maggiore Policlinico Milan, Milan, Italy

**Background and Aims** The efficient digestion of milk triglycerides is guaranteed by the combined action of gastric lipase, colipase-dependent pancreatic lipase, and bile salt-stimulated lipase (BSSL). Human milk contains the major part of BSSL. Data regarding the dynamic changes of human milk BSSL are scarce.

The aim of this study was to evaluate the changes of human milk BSSL content at different stages of lactation by proteomic techniques.

**Methods** We designed a prospective longitudinal study. Human milk samples were collected from 18 healthy mothers who delivered a singleton term newborn (Cesarean age 37–41 weeks) on the 3rd, 7th, 15th, and 60th postpartum day. Proteomic techniques were carried out to evaluate different profile expression of BSSL in milk: in particular SDS-PAGE analysis coupled with LC-MS MS mass spectrometry.

**Results** BSSL levels increased significantly from the 3rd to the 60th postpartum day (figure).
Background and Aims To date there are no reports of intra-subject variability for intrahepatocellular lipid (IHCL) assessed using 1H NMR spectroscopy in neonates. This study utilized a high-field (3-Tesla) MRI scanner to perform repeated assessment of IHCL on neonates.

Methods

Measurements were acquired using a 10 x 10 x 10 mm voxel during 90 seconds. IHCL was assessed using the ratio between the lipid and water peaks. The within subject coefficient of variation (WS CV) was calculated.

Results

In 15 babies, MRS was measured twice in each lobe in the same region of interest. Values > 0.2 gave reproducible results; the WS CV was 12% on the right and 3% on the left. MRS was measured once in each lobe in 32 babies (GA at birth median 36 weeks, range 24–42; GA at scan median 42 weeks, range 37–46). Among 17 babies with MRS > 0.2 on both sides WS CV calculated between left and right for was 54% (95% CI 50–58%) and Mean (SD) was 0.73 (0.33) on the right and 0.58 (0.42) on the left (p<0.005).

Conclusions

Neonatal IHCL measured using 3T is markedly lower than other age groups and systematically higher on the right than the left possibly reflecting the influence of lobe size and cardiac pulsation. Values ≤ 0.2 are imprecise and should be classified as below the limit of quantification. The optimal imaging strategy is likely to use a consistent region of interest within the right lobe.

SEX DIFFERENCES IN ADIPOSE TISSUE QUANTITY AND DISTRIBUTION IN NEWBORN INFANTS

doi:10.1136/archdischild-2012-302724.0360

KM Logan, MJ Hyde, C Gale, JR Parkinson, S Jeffries, N Modi. Neonatal Medicine, Imperial College London, London, UK

Background and Aims

Adipose tissue (AT) quantity and distribution influence metabolic health. In adult life women have greater total and subcutaneous AT, but men have greater internal abdominal AT (Gender Medicine, 2009; 6: 60–75). We aimed to explore AT volume and distribution in newborn male and female infants using magnetic resonance imaging (MRI).

Methods

A retrospective observational study was performed, using an existing database of neonatal body composition data, to compare male and female healthy term infants.

Results

Abstract 360 Table 1

<table>
<thead>

<th>Male (n=95)</th>
<th>Female (n=90)</th>
<th>p value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total AT</td>
<td>746 [718, 774]</td>
<td>841 [812, 869]</td>
<td>&lt;0.001</td>
</tr>
<tr>
<td>Abdominal superficial subcutaneous AT (SSAT)</td>
<td>102 [97, 107]</td>
<td>122 [117, 128]</td>
<td>&lt;0.001</td>
</tr>
<tr>
<td>Non-abdominal SSAT</td>
<td>540 [519, 560]</td>
<td>606 [586, 627]</td>
<td>&lt;0.001</td>
</tr>
<tr>
<td>Abdominal deep subcutaneous AT (DSAT)</td>
<td>14 [13, 15]</td>
<td>18 [17, 20]</td>
<td>&lt;0.001</td>
</tr>
<tr>
<td>Abdominal internal AT (IAT)</td>
<td>22 [20, 24]</td>
<td>21 [20, 23]</td>
<td>0.672</td>
</tr>
<tr>
<td>Non-abdominal IAT</td>
<td>56 [53, 60]</td>
<td>59 [55, 63]</td>
<td>0.310</td>
</tr>
</tbody>
</table>

Conclusions

Female newborn infants have higher total and subcutaneous AT, but similar internal abdominal AT compared to males. Longitudinal study is required to assess gender specific alterations in AT distribution during infancy and childhood, and may identify possible influences of internal abdominal AT development in males.

OVERWEIGHT AND SCHOLASTIC ACHIEVEMENT IN CHILEAN SCHOOL-AGE CHILDREN

doi:10.1136/archdischild-2012-302724.0361

OC Flores, VF Arias, CV Ibaceta, YZ Orellana, IE Mena, VC Arancibia, AF Almagía, PA Lizana, GI Morales, RA Burrows, DM Ivanovic. University of Chile, INTA; Pontifical Catholic University of Chile, Santiago; Pontifical Catholic University of Valparaíso, Pontifical Catholic University of Chile Catholic University of Valparaíso, Valparaíso; University of Chile, Faculty of Medicine, Santiago, Chile

Background and Aims

Overweight has been linked to health problems and deteriorate school outcomes. Some studies show that overweight school-age children have lower scholastic achievement (SA) but the evidence is controversial. The aim of this study was to determine the association between overweight and SA in elementary fifth grade school children from the Chile’s Metropolitan Region.

Methods

This was an observational, cross-sectional and correlational study. Data were reported for 477 children of both sexes and from 26 schools (public, subsidized and non-subsidized). SA was measured with the Education Quality Measurement System test score (SIMCE), of national coverage. The current nutritional status was assessed through the body mass index z-score (z-BMI), controlling for dietary and physical activity behaviours, socio-economic status (SES), family and educational factors. Data were processed using descriptive statistics and multiple linear regressions from the Statistical Analysis System software (SAS).

Results

Overweight children had not significantly lower SA compared with non-overweight children (P=0.05). SES (P=0.001), type of school (P<0.01), the number of repeated grades (NAG) (P<0.05) and parents’ educational level (P<0.05) were the variables that correlated with SA. SES, the NRG and mother’s educational level, were the variables with the greatest explanatory power for SA variance. The current nutritional status expressed as z-BMI did not contribute to explain SA variance.

Conclusion

Current nutritional status was not associated with SA. SES, the number of repeated grades and mother’s educational level could be strong predictors of SA.

HIGH INCIDENCE OF IRON DEFICIENCY IN HEALTHY YOUNG INFANTS IN THE NETHERLANDS: PRELIMINARY RESULTS OF THE IROSTAT STUDY

doi:10.1136/archdischild-2012-302724.0362

1 LJ Uijterschout, PP Teunisse, C Hudig, WW Rövekamp-AbeIs, SCAT Verbruggen, 3J van Goudoever, F Brus. 1Juliana Children’s Hospital/HAGAziekenhuis, The Hague; 2Erasmus MC - Sophia Children’s Hospital, Rotterdam; 3VU University Amsterdam, Amsterdam; 4Academic Medical Center, University of Amsterdam, The Hague, The Netherlands

Background

Iron deficiency (ID) and iron deficiency anemia (IDA) during infancy are associated with poor neurological development. A food consumption survey in the Netherlands showed that the median iron intake of infants, aged 2 to 3 years, was below the advised adequate intake of 7 mg/day.

Aim

To investigate the iron status in healthy young infants in the Netherlands and to identify risk factors for ID.

Methods

We conducted a multi centre, observational study in healthy young infants aged 0.5 to 3 years. We measured serum...
