emphasizes the importance of early diagnostic. Interdisciplinary clinical criteria, karyotype, FISH and methylation analysis (MS-PCR, MS-MLPA) are the main steps for a successful diagnostic protocol. Genetic tests results show a particular molecular profile in Romania with only 47% positive methylation results unlike literature (99%).

**Abstract 732 Turner Syndrome: A Clinico-Cytogenetic Study of 37 Children**

doi:10.1136/archdischild-2012-302724.0732

1IE Jurca-Simina, 1M Gafencu, 2D Dan, 3M Puiu. 1Pediatrics, University of Medicine and Pharmacy, Timisoara; 2President of Romanian Prader Willi Association, Zalau; 3Genetics, University of Medicine and Pharmacy, Timisoara, Romania

**Background and Aims**

Turner syndrome (TS) is defined by total or partial loss of the sex chromosomes X. Features vary widely including short stature and ovarian failure inconstantly associated with characteristic face, skeletal malformations, renal and cardiac anomalies and endocrine disorders.

We analyzed the clinical and cytogenetic profiles of 37 TS children diagnosed with TS from January 2007 to December 2011 in the aim to establish genotype-phenotype correlations.

Growth delay and hypothyroidism were noted respectively in 89.2% and 19.4% of patients. Diabetes and celiac disease was observed in 5.6% of cases. 55% of our cohort had a 45, X karyotype, 8.1% had 45, X/47, XXX mosaicism and 5.4% have 45, X/46, XY mosaicism. Interestingly, FISH revealed the presence of SRY gene. The remained had structural abnormalities: 55.1% had isochromosome Xq which was homogenous in roughly half of cases. 10.8% were diagnosed with a terminal deletion Xp and 5.4% with a ring of chromosome X.

There was no correlation between genotypes and clinical features. The short stature in girls with TS is thought to be related to the haploinsufficiency of the SHOX gene on Xp22.3. As a result, treatment with GH is now routinely adopted even if the GH hormone is normally secreted. The higher risk of autoimmune diseases in women with TS could result from haploinsufficiency of the FOXP3 gene on Xp 11.23.

Otherwise, we highlight the importance of detection of 45, X/46, XY mosaicism which may be cryptic requiring SRY probe FISH screening a condition that exposes to gonadoblastome and special chirurgical preventive treatment.

**Abstract 733 Bacterial 16S rRNA Genetic Markers for Fecal Samples to Differentiate Choledochal Cyst from Biliary Atresia**

doi:10.1136/archdischild-2012-302724.0733

T Okada, S Honda, H Miyagi, A Takemori. Department of Gastroenterological Surgery I, Hokkaido University Graduate School of Medicine, Sapporo, Japan

**Background and Aims**

Microbiota in fecal content from choledochal cyst (CC) and biliary atresia (BA) individuals at the operation were compared using 16S rRNA gene libraries and terminal restriction fragment length polymorphism (T-RFLP).

**Methods**

From 2002 to 2011, 1 infant with CC and 7 infant with BA (infants ≤ 2 months of age) were treated at our institute. Fecal samples were obtained at the radical operation for CC and BA. Total fecal DNA was isolated and PCR was performed. The amplification of the fecal 16S rDNA, restriction enzyme (BsiI), size-fractionation of T-RFs and T-RFLP data analysis were performed. To compare the T-RFLP patterns among samples between CC and BA patients, the
### 734 ASSESSMENT OF DNA DAMAGE USING COMET ASSAY AND DETECTION OF OXIDATIVE STRESS PARAMETERS IN DOWN SYNDROME

**Background** Down syndrome is one of the commonest numerical chromosomal aberrations. Recent studies showed that oxidative stress is an important pathological factor in Down syndrome.

**Objective** To estimate the level of oxidative stress and DNA damage in Down syndrome patients.

**Patients and methods** Fifteen Egyptian patients clinically diagnosed and cytogenetically proven to have Down syndrome. Fifteen Egyptian healthy controls were recruited from the outpatient clinic of Clinical Genetics Department, National Research Centre. Oxidative stress parameters including total antioxidant capacity (TAC), Superoxide dismutase (SOD) enzyme activity and Malondialdehyde (MDA) biomarkers were estimated. DNA damage was determined using the alkaline comet assay.

**Results** The MDA and SOD levels in Down syndrome patients were significantly higher than control group (p=0.000 & 0.01, respectively). Total antioxidants levels were non-significantly higher than control group (p=0.54). Statistical analysis of DNA damage levels in DS patients compared to controls showed significantly increased levels (p=0.000). There was a positive correlation of DNA damage levels with age in DS patients but not reaching a significant level (p=0.056). A non-significant positive correlation was detected between DNA damage levels and both MDA and TAC levels (p=0.08 & 0.03, respectively). Also a non-significant negative correlation of DNA damage levels with SOD levels was noticed (p=0.14).

**Conclusion** Oxidative stress plays a major role in DS pathogenesis.

### 735 CONTRIBUTION OF ALKYLATING AGENTS IN THE CYTOGENETIC DIAGNOSIS OF FANCONI ANEMIA

**Background and Aims** Fanconi Anemia (FA) is an autosomal recessive disease characterized by heterogenous phenotype which includes a bone marrow failure, diverse abnormalities and increased predisposition to develop leukemia. The cytogenetic diagnosis of FA involves bifunctional alkylating agents, resulting in greatly increased chromosomal breakage and radial stuctures induced by cross-linking agents. To estimate the sensitivity and the specificity of the Mitomycin C (MMC) and the Die.pyoxynbutan (DEB), two alkylating agents used in the diagnosis of the FA, we studied the chromosomal instability on 22 patients using variable types and concentrations of these alkylating (25 and 40 ng/ml of MMC, 0.1 μg/ml of DEB).

**Methods** Heparanized venous blood samples were collected and were processed for the cytogenetic methodology in this study. After culture, 100 of metaphases were analysed to evaluate the frequency of chromosomal aberrations.

**Results** The MMC test at 25ng/ml was High sensitive for the FA. The DEB test showed a better specificity. The study of the mitotic segregation of sexual chromosomes by FISH took away any abnormality of the segregation to cells FA.

**Conclusions** A molecular study of the sensitivity and the specificity of the alkylating agents used according to the group of complementation will come refine the diagnosis of FA by establishing a gold standard.

### 736 CLINICAL AND CYTOGENETIC STUDY IN 116 CHILDREN COHORT WITH SEXUAL AMBIGUITY

**Disorder of sex development** may result from multiple etiologies, led to many physical impacts involving genital abnormalities. Differentiation of a testis or an ovary from a bipotential gonad is a complex developmental process where various genes and hormones interact. Thus, the causality of sexual ambiguity was supported by the presence of many chromosomal abnormalities, especially when sex determination genes were involved.

A careful clinical examination will primarily interest to define the sexual ambiguity Prader score and the whole genital and extra genital malformation context.

Our study focuses on cases referred to the department of Cytogenetics and Reproductive Biology CHU Farhat Hached for ambiguous genitalia cytogenetic exploration from January 2010 to February 2012. The 116 patients studied with ambiguous genitalia of varying severity, 80% were younger than 10 years. 7.5% of them showed chromosomal abnormalities.

In 3 patients, the chromosomal abnormality involved the autosomes 4, 5 and 1 with a 4p deletion in Wolf-Hirschhorn syndrome, deletion 5p in Cri-du-chat syndrome and 1q deletion revealed by Comparative Genomic Hybridization-array. Theses anomalies are associated with loss of genetic differentiation protein function. In 4 other patients abnormal sexual chromosome number was identified. For 86 children with normal karyotypes 46, XY, SKY gene molecular cytogenetic screening was performed. A deletion may in these cases explain the phenotype.

Identification of gene rearrangements causing urogenital birth defects can have an impact on the diagnosis and genetic counseling. Thus more study is necessary to find new candidate genes in signaling pathways regulating sexual differentiation.

### 737 MOLECULAR CYTOGENETIC AND COMPARATIVE GENOMIC HYBRIDIZATION ANALYSIS IN NEWBORNS WITH CONGENITAL HEART DISEASES

**Congenital heart diseases** (CHD) are abnormalities that occur at birth and resulting from a developmental defect during cardiac
Cyst from Biliary Atresia

Fecal Samples to Differentiate Choledochal Cyst from Biliary Atresia
