TREATMENT MODALITIES IN PERIPHERAL FACIAL NERVE PALSY IN CHILDREN AND ADOLESCENTS

1) J Samardzic, 2) B Kukolj, 3) M Iovanovic, 4) O Djuric, 5) I Jancic. 1Institute of Pharmacology, Clinical Pharmacology and Toxicology, Medical Faculty, University of Belgrade, Belgrade, Serbia; 2Division of Paediatric Pharmacology and Pharmacoepidemiology, University of Basel Children’s Hospital, Basel, Switzerland; 3Medical Faculty, University of Belgrade; 4Institute of Epidemiology, Medical Faculty, University of Belgrade; 5Clinic of Neurology and Psychiatry for Children and Youth, Medical Faculty, University of Belgrade, Belgrade, Serbia

The acute one-sided mimic musculature weakness is mostly idiopathic. The effectiveness of the CS therapy was strongly supported, suggesting CS as a core treatment for the Bell’s palsy. It has been shown the faster recovery of children at younger age. While CS/vitamins (42.0%) and CS/antiviral/vitamins (17.0%), the majority of patients were treated with combined CS only received 22.7% of patients, all with an appropriate physical treatment. The group of idiopathic paralysis makes 62.5%, while the incidence of symptomatic paralysis is 37.5%; however, the recovery rate between these groups has not been shown (p=0.309). Patients received CS therapy were divided into 4 groups: CS only, CS+antiviral, CS+vitamins B, and CS+antiviral+vitamins B. The statistically significant recovery was registered in each group (p< 0.001); however, no difference was found between the groups in term of recovery rate (p=865). For the assessment of recovery period in relation to the age, the obtained p value was 0.054, a borderline level, suggesting a faster recovery of children at younger age.

Conclusion The acute one-sided mimic musculature weakness is mostly idiopathic. The effectiveness of the CS therapy was strongly supported, suggesting CS as a core treatment for the Bell’s palsy. It has been shown the faster recovery of children at younger age.

THE POTENTIAL IMPACT OF HEMATOCRIT CORRECTION ON EVALUATION OF TACROLIMUS TARGET EXPOSURE IN PEDIATRIC KIDNEY TRANSPLANT PATIENTS

1) A Schijvens*, 2) F van Hesteren, 3) M Cornelissen, 4) Bootma-Robroeks, 5) Brüggemann, 6) M de Wilde, 7) M Schreuder, 8) ter Heine. 1Pediatric Nephrology, Radboud University Medical Center, Radboud Institute for Molecular Life Sciences, Amalia Children’s Hospital; 2Pharmacy; 3Department of Pharmacology and Toxicology, Radboud University Medical Center, Radboud Institute for Health Sciences, Nijmegen; 4Intensive Care and Department of Pediatric Surgery, Erasmus MC Sophia Children’s Hospital, Rotterdam, The Netherlands

Background Tacrolimus is an important immunosuppressive agent with high intra- and interindividual pharmacokinetic variability and a narrow therapeutic index. As tacrolimus extensively accumulates in erythrocytes, hematocrit is a key factor in the interpretation of tacrolimus whole blood concentrations. However, as hematocrit values in pediatric kidney transplant patients are highly variable after kidney transplantation, translating whole blood concentration targets without taking hematocrit into consideration, is theoretically incorrect. The aim of this study is to evaluate the potential impact of hematocrit correction on tacrolimus target exposure in pediatric kidney transplant patients.

Methods Data were obtained from 36 pediatric kidney transplant patients. 255 tacrolimus whole blood samples were comprised the impact of substances (drugs, medications and others) in pregnant women, nursing mothers, the unborn child, the premature, the newborn baby and the breastfed baby. Most of the drugs are off-label used. In this field grand challenge for Frontiers in Medicine emphasizes the importance of translational medicine.

Aim The primary goal of SAPP has always been and remains the same: it is the link between medicine and pharmacy, between practice, clinic, research and health authorities, in order to increase the safety of medicines in the population of pregnant and breastfeeding women and their newborns.

Methods On December 6, 2007, an interdisciplinary team of 8 physicians and pharmacists founded the Swiss Association of Perinatal Pharmacology, SAPP. It collects and promotes new findings in the field of perinatal pharmacology.

Results Specialists from all areas of perinatal pharmacology work together in a scientific committee to develop and update evidence-based principles for work in everyday clinical practice (hospitals, doctor’s surgeries, pharmacies). Today, around 200 members benefit from this, who can orient themselves in regular further training courses and basic documents (monographs of active substances, therapy recommendations based on original literature). The SAPP thus closes the gap resulting from the predominant off-label use and the resulting lack of information on drugs in this population.

Conclusion The primary objective of SAPP has been achieved - it provides guidance for the practitioners in the broad field of perinatal pharmacology.

THE SWISS ASSOCIATION OF PERINATAL PHARMACOLOGY, SAPP: GOALS

L Schenkel*, U von Mandach, The Editorial Board of the SAPP. Obstetrics, University Hospital of Zurich, Zurich, Switzerland

Background The medicine of pregnant women practices to a targeted personalized approach, tailored to the specific characteristics and needs the implications of interdisciplinary work between healthcare stakeholders. Perinatal pharmacology comprises the impact of substances (drugs, medications and others) in pregnant women, nursing mothers, the unborn child, the premature, the newborn baby and the breastfed baby. Most of the drugs are off-label used. In this field grand challenge for Frontiers in Medicine emphasizes the importance of translational medicine.

Aim The primary goal of SAPP has always been and remains the same: it is the link between medicine and pharmacy, between practice, clinic, research and health authorities, in order to increase the safety of medicines in the population of pregnant and breastfeeding women and their newborns.
