location of the hip, scoliosis, deformities of the foot and orthopaedic and neurological problems of cerebral palsy are in German: the articles on slipped femoral epiphysis and osteochondritis affecting the lower limb are in French.

**Planning and Operating Facilities for Crippled Children.**

This book gives useful and practical advice about the details of providing for physically handicapped children. It is divided into three parts dealing with hospital schools, non-residential schools with treatment facilities and camps. In each section the actual building, even the choice of a site, the equipment and the staffing are discussed at length, and most of the points that might arise in planning such centres seem to be covered.

The author touches also on many general problems in this field, such as the philosophy that should guide those working with the handicapped and the different methods of providing education for them, each with its advantages and disadvantages, and his views are obviously based on wide experience and a humane outlook.
