Admit an emergency. Admit a case for Ceporin.

A child has been admitted. She’s been vomiting, is now comatose and has neck rigidity. She also has an ear infection which hasn’t responded to penicillin treatment. It all points to meningitis.

It is a penicillin-resistant organism.

We admit there’s a case for Ceporin.

Ceporin kills the majority of gram-positive and gram-negative organisms.

It also kills the penicillin-resistant staph. And it’s as painless as an injection can be.

When you suspect meningitis, you can trust Ceporin to act fast. Give it intravenously. Give it intrathecally too. So you can ensure adequate CSF levels. And eradicate the infection.

With meningitis you’re dealing with an emergency. And you’ll admit that’s the case for Ceporin.

Presentation

Vials containing 100 mg, 250 mg, 500 mg and 1 gram cephaloridine in boxes of five.
THE STANCO
BLUE LIGHT
UNIT

Phototherapy for the treatment of
Neonatal Jaundice

Neonatal jaundice is potentially dangerous and can lead to kernicterus, i.e. damage to the central nervous system. This applies in particular to the premature infant.

It has been shown, that in some cases of neonatal jaundice, serum bilirubin levels can be reduced by exposing infants to an artificial light source of suitable wavelength, i.e. 420mµ to 480mµ (Blue Light).

Working in conjunction with a Paediatric team at a well-known hospital, the “Stanco” Blue Light apparatus has been developed and given satisfactory clinical trials.

The apparatus takes the form of a tunnel supported by four legs, each fitted with large castor wheels and each adjustable to facilitate the use of cots and incubators of different heights.

The arch of the tunnel supports 10 Light Blue 24” (60cms) 40 watt florescent tubes with reflectors angled to give a maximum and even radiation of the infant and suitably spaced to ensure adequate air circulation to reduce heat.

Exterior finish is white enamel, thus assisting in re-radiation of random light rays and giving maximum available irradiation of the infant.

Dimensions—Adjustable height: Maximum 85” Minimum 51” (Measured from floor level to apex of tunnel). Width: 46” Length: 25”.

Mead Johnson products
for choice in the dietary treatment of

**Milk Intolerance**

**Nutramigen**
Complete hydrolised protein formula.

**Sobee**
Complete lactose free soya formula.

**ProSobee**
Complete lactose free liquid formula.

**Fat Intolerance**

**Portagen**
Complete medium chain triglyceride formula.

**MCT**
Medium chain triglyceride oil.

**Phenylketonuria**

**Lofenalac**
Complete low phenylalanine formula.

All of these products may be prescribed on form E C 10 for the treatment of specific conditions. *Recipe booklets available on request. Full information on all products available from Mead Johnson Laboratories Division of Bristol-Myers Company Ltd., Stamford House, Langley, Bucks.*
Penbritin for infections in children

Penbritin combines broad-spectrum activity with penicillin-safety for the treatment of infections in children. Penbritin is pleasant to take—there are two strengths of palatable syrup, tablets, capsules and, for the very young, a paediatric drop presentation; vials for injection are also available, if required. With ten years of clinical success, a well proven safety record and a wide choice of presentations, Penbritin is the ideal antibiotic for infections in children.

There's nothing quite like Penbritin

Further information is available on request.
Penbritin* (ampicillin) is a British product originated by Beecham Research Laboratories, Brentford, England.

A new palatable presentation of pancreatin granules.

ZYPANAR considerably reduces the taste associated with normal pancreatins.

Zypanar granules contain proteolytic and amylolytic activities equivalent to Pancreatin 3.N.F. It also contains lipolytic activity equivalent to not less than 20 lipase u./gm. (Willstater). The granules are wax-protected so that optimum effect occurs in the intestines. It has been found that the presentation considerably reduces the taste associated with normal Pancreatin.

Indicated in
Cystic Fibrosis
Steatorrhea
Pancreatitis
Other symptoms of Pancreatic Deficiency

Packs
Bottles of 200 and 500 grammes.

PKU treatment
simple·effective·
safe·low cost

ALBUMAID XP
Albumaid XP has an unequalled record in the active growing
period in a child's life in respect of height, weight and neuro-
logical development. It contains all the essential elements of
beef and is just as palatable. Every child is safe with Albu-
maid XP.

PKAID I
PKAID I allows a variation in the low-phenylalanine diet of
children who are 3 years old and upwards and this is of great
value. Other alternatives cost considerably more. You can
reduce your prescribing costs with PKAID I.

PKAID II
PKAID II is excellent for older children on a low protein
high calory diet. They will benefit considerably from its
inclusion in your treatment with as little as 10 grams a day.
Your prescribing costs will be greatly reduced with PKAID II.

TRIALS CONFIRM FLOXAPEN’S EXCELLENT PERFORMANCE

Treatment succeeded clinically in 26 patients with staphylococcal infections and failed in four. It was unsuccessful either clinically or bacteriologically in two of three patients with pneumococcal infections.

There were no serious side-effects. No undue pain was experienced at the site of the injection.

It is concluded that flucloxacillin is a useful addition to the therapeutic armamentarium against benzylpenicillin-resistant staphylococci.

Floxapen, like Orbenin (cloxacillin B.P.), is active against virtually all staphylococci and all streptococci and pneumococci irrespective of their sensitivity to traditional penicillins, tetracyclines, fusidic acid, erythromycin and lincomycin.

The standard dose of Floxapen is only 250 mg. and will attain similar serum levels by oral or injectable routes. Therapy is therefore simpler and more effective than with Orbenin.

Floxapen offers the penicillin advantages of low toxicity and bactericidal action. It is also ideal for continuing outpatient treatment because of its convenient oral dosage.

Further information is available on request.

Indications: Infections due to sensitive Gram-positive organisms, including resistant staphylococci: skin and soft tissue infections, otitis media, sinusitis, infected wounds and burns, osteomyelitis and septic arthritis, pneumonia, empyema, septicaemia, endocarditis and meningitis.

Dosage Oral and intramuscular:
   Adults: 250 mg. q.i.d.
   Children 2-10 years—½ adult dose.
   Under 2 years—¼ adult dose.

Oral doses should be taken one hour before meals.
In severe infections dosages may be increased if required.

Availability Syrup 125 mg./5 ml.
   Capsules (black/caramel) and Vials, each containing 250 mg. flucloxacillin.

Contra-indications Penicillin hypersensitivity.
   Subconjunctival injection.

Side-effects As with other penicillins.

Floxapen (flucloxacillin) is a British product originated by Beecham Research Laboratories, Brentford, England. *regd
This hydrocephalic child has been wearing the

**SILASTIC®**

**Hydrocephalus Shunt**

for four years without revision (and it’s not in her vascular system)

SILASTIC Hydrocephalus Shunt (Ames design)

Single unit, double chamber flushing device offers positive check on shunt function and patency

An improvement in the management of hydrocephalus that bypasses the vascular system by draining excessive fluid into the peritoneal cavity. Extra long peritoneal tubing accommodates child’s growth, eliminates periodic revisions.

Double chamber design permits selective flushing of either catheter and keeps pressure away from burr hole. Device also provides a convenient self-sealing route for injection or withdrawal of fluids.

In the dietary management of phenylketonuria, protein hydrolysate based foods tend to be unpalatable and difficult to administer. Compared with them, Aminogran is less unpalatable, smaller in bulk, and can be given as a medicine. It does not, therefore, interfere greatly with the child's appetite for permitted foods, and the diet can more closely resemble that of a normal child.

An Aminogran based diet is more readily accepted by the child and creates fewer family problems. Anorexia, food fussiness and emotional disturbances are much reduced.

"The children accepted it (Aminogran) easily and fed it to themselves instead of having to be spooned or force fed, and consequently the quality of family life improved."

Each carton of Aminogran includes a 150g container of amino acid food supplement and a 50g container of mineral mixture.

Full information is available on request.

Recent Advances in Paediatrics
Edited by DOUGLAS GAIRDNER and DAVID HULL
1971 Fourth Edition 576 pages, 83 illustrations £6.00

'The contents provide an authoritative and up-to-date account of some of the growing points of paediatrics.'—Practitioner.

'It is a pleasure to see another edition in this series. Once more Douglas Gairdner has collected together a band of experts to cover a broad spectrum of growing subjects.
Geoffrey Dawes writes about fetal and neonatal respiration, Margaret Ounsted about fetal growth, David Hull about neonatal asphyxia, Jon Scopes about the respiratory distress syndrome, William Walker about haemolytic disease, Edmund Hey about the care of the baby in the incubator, Milner about the assessment of respiratory function, Salvatore Raiti about the assessment of endocrine function, Dick White about the nephrotic syndrome, Helen Pond and Whittington about diabetes, Christopher Ounsted about epilepsy, McCance about malnutrition in underdeveloped countries, and Cedric Carter about genetics.
This is a valuable book which paediatricians will have to buy.'—British Medical Journal.

Published by
CHURCHILL LIVINGSTONE . Teviot Place . Edinburgh
Obesity in childhood is becoming recognised as a very common problem. In fact it is the commonest nutritional disorder of childhood in developed countries. It has been shown that rates of atherosclerotic heart disease, hypertensive heart disease, cardiovascular renal disease and diabetes mellitus are higher amongst those who were overweight in childhood. Children become obese because their calorie intake exceeds their particular requirements and is quite commonly developed in early infancy.

The dietary control of established obesity in childhood is notoriously difficult and here many factors are playing a part. In these circumstances the combination of dietary control and drug treatment can often be more successful. Amphetamine-like compounds, with their risks of central stimulation, addiction and tolerance, are better avoided. Ponderax (fenfluramine) which is without these effects can be used very beneficially in established obesity in children.*

COTAZYM

has accurately assayed lipase activity

Pancreatic replacement therapy can be adjusted to cover the exact amount of fat in the patient’s diet.

**Cotazym** is the only pancreatic extract with known, measurable and constant lipase activity, in addition to adequate measured amounts of trypsin and amylase. It allows simple but accurate estimation of dosage ensuring greater control over dietary intake.

Each capsule contains:
- lipase sufficient to digest 17g dietary fat
- trypsin sufficient to digest 34g dietary protein
- amylase sufficient to digest 40g dietary starch.

**Indications:**
pancreatic deficiency states including post-gastrectomy malabsorption, fibrocystic disease and gastro-intestinal disorders resulting in steatorrhoea.

**Dosage:**
dosage is calculated on the fat digesting power of the lipase. 2 to 3 capsules taken with each main meal and one capsule with a snack is sufficient to cover normal daily fat intake. The contents of the capsule should be sprinkled over the food.

Diseases of the Urinary Tract

One of the most rapidly growing specialties over the last few years has been that of urology. Many doctors now in practice could not have been taught much of the present-day management of many urinary tract diseases. Last year the B.M.J. published a series of 'Current Practice' articles on diseases in the urinary tract, and these have now been collected together in a booklet. Beside articles on the newer aspects of the specialty, the booklet contains articles on established methods of managing renal disorders. Any doctor who wishes to bring himself up to date on modern practice in this field will find this a readable account of the important aspects of the specialty.

Metabolic Aspects of Disease

Treatment of inborn errors has advanced our basic knowledge of disease. Metabolic problems are also a frequent consequence of disease.

**Precision Products:**

- Designed to meet the metabolic defect are called for.
- Products more fundamental than enzymes.
- Products more basic than protein.
- Products which enable precise nutrition.
- Products which succeed where cows' milk is a failure.

**Precision Products for:**

- Phenylketonuria, Homocystinuria,
- Cystinosis, Maple Syrup Urine Disease
- Hyperglycaemia, Hyperprolinaemia,
- Arginine Succinic Urea,
- Histidinaemia, Tyrosinosis,
- Carbohydrate and Protein Intolerance,
- Malabsorptions, Cystic Fibrosis,
- Glycogen Storage Disease.

**MILNER SCIENTIFIC AND MEDICAL RESEARCH**

Now maintains a world-wide interest in every aspect of metabolism in disease, and products are directly available in most countries.
