**401 VENTILATION PARAMETERS DURING RESUSCITATION: COMPARISON OF TWO DIFFERENT DEVICES IN A MANNEQUIN MODEL WITH AND WITHOUT DISTRACTION**  
doi:10.1136/archdischild-2012-302724.0401

1-N Gupta, 1-M Thio, 1-UA Dawson, 1-CF Kamlin, 1GM Schmoezier, 1-PG Davis. 1-Newborn Services, The Royal Women’s Hospital, Melbourne, VIC, Australia; 2-Neonatal Unit, John Radcliffe Hospital, Oxford, UK; 3-Murdoch Children’s Research Institute, Melbourne, VIC, Australia

**Background and Aims** Positive pressure ventilation is a common intervention in neonatal resuscitation. Distraction, type of device and experience may influence performance. Studies have not included self-inflating bags (SIB) equipped with a PIP manometer and expiratory PEEP valve. We aimed to compare clinicians’ ability to ventilate a mannequin using a SIB with additional manometers against a T-piece (TP), with and without distraction.

**Method** 50 medical and nursing staff were tested using standardised case scenarios with a leak free intubated mannequin. Participants targeted PIP 30 cmH2O, PEEP 5 cmH2O, inflation rate (IR) 60 inflations/minute with both devices in randomised order. We analysed PIP, PEEP, IR, expired tidal volume (TVe), professional group and compared devices during baseline and 3 minutes of distraction.

**Results** 12,981 inflations were analysed. Mean (SD) ventilation parameters are shown in table.

### Abstract 401 Table 1

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Baseline</th>
<th>Distraction</th>
</tr>
</thead>
<tbody>
<tr>
<td>TP</td>
<td>29.3 (0.6)</td>
<td>29.0 (2.3)</td>
</tr>
<tr>
<td>PIP</td>
<td>42.6 (0.6)</td>
<td>5.5 (0.9)</td>
</tr>
<tr>
<td>IR</td>
<td>53.6 (10.3)</td>
<td>56.6 (11.7)</td>
</tr>
<tr>
<td>TVe</td>
<td>10.2 (1.8)</td>
<td>9.7 (0.9)</td>
</tr>
</tbody>
</table>

When analysed by operator, more variation was observed in IR (P=0.029) and TVe (P=0.002) with SIB during distraction.

**Conclusions** Clinicians’ general performance when using a SIB where PIP and PEEP are displayed is comparable to a T-Piece; however, more variation in IR and TVe occurs under distraction. This may be relevant in a real resuscitation.

**402 EFFECT OF ANTENATAL CORTICOSTEROIDS IN ACTIVITY AND EXPRESSION OF SECRETORY PHOSPHOLIPASE A2 AND TNF ALFA IN LUNG OF NEWBORN RATS**  
doi:10.1136/archdischild-2012-302724.0402

**Introduction** The sPLA2 plays an important role in the development of acute respiratory distress syndrome. It is regulated by many factors including steroids and TNFas. Antenatal corticosteroids are recommended for preventing respiratory distress syndrome in preterm infants. Recent studies suggest that betamethasone might be a better choice than dexamethasone. The aim of this study is evaluate differences between both antenatal corticosteroids in the regulation of sPLA2 and TNFas.

**Methods** Dexamethasone, betamethasone or saline were administered intravenously to pregnant Wistar rats on the 20th and 21st days of gestation. We evaluated pulmonary sPLA2 and TNFas mRNA in newborn rats at birth by RT-PCR. We also evaluated sPLA2 activity by an ultrasensitive non-radioactive method on microplate and the TNFs protein expression by ELISA. Differences between the groups were determined by one way ANOVA (p<0.05).

**Results** We observed a statistically significant decrease in the sPLA2 mRNA in the betamethasone (0.61) and dexamethasone (0.26) groups respect the control (1.05) group and a decrease in the sPLA2 activity in the betamethasone group (33.78) respect the control group (50.74). We observed a statistically significant decrease in the TNFas protein in the betamethasone group (472.61) respect the dexamethasone group (768.65).

**Conclusions** Antenatal glucocorticoids inhibits the expression of sPLA2 through the reduction of TNFas in the lung of newborn rats. These potential beneficial effects are more evident in the group treated with antenatal betamethasone. Our studies also support the notion that betamethasone could be the drug of choice for treating pregnant women at risk of preterm delivery.

**404 DSPC-PALMITATE KINETIC IN A MODEL OF LUNG UNILATERAL ACID INJURY**  
doi:10.1136/archdischild-2012-302724.0404

**Background and Aim** Whether pulmonary surfactant deficiency or dysfunction contributes to the pathogenesis of neonatal pneumonia is still debated. Aim of our study was to measure surfactant disaturated-phosphatidylcholine (DSPC) kinetics and surfactant specific proteins A and B (SP-A, SP-B) amount in term newborns with pneumonia using stable isotopes as tracers.

**Methods** Twenty-seven term newborns (GA 39.0±1.5 weeks, BW 3165±802 g) requiring mechanical ventilation were studied. Twelve had severe pneumonia and 15 no lung disease. All newborns received intra-tracheally 2 mg/kg 1-13C-DPPC mixed with 2 mg/kg of exogenous surfactant. Isotopic enrichment of DSPC palmitate was measured from tracheal aspirates by mass spectrometry and kinetic data calculated. Surfactant proteins were measured by ELISA. Data were expressed as median (interquartile range) and comparisons were performed by Mann-Whitney test. p<0.05 was regarded as statistically significant.

**Results** DSPC pool size (PS) was 9.3 mg/kg (3.1–30.2) in newborns with pneumonia and 38.0 mg/kg (24.9–124.6) in controls, p=0.016. DSPC half-life (HL) was 12.7 h (5.2–20.2) and 25.6 h (18.5–66.5) in newborns with pneumonia and 38.0 mg/kg (24.9–124.6) in controls, p=0.016. Analysis for SP-A and SP-B are in progress. In newborns with pneumonia a correlation was found between DSPC kinetic parameters and oxygen requirement (DSPC PS and mean FiO2, R=–0.54, p=0.047; DSPC HL and mean FiO2, R=–0.61, p=0.016). In newborns with pneumonia and in controls, respectively (p=0.004).

**Conclusions** Surfactant DSPC kinetics was found to be markedly impaired in term newborns with pneumonia. Preliminary data suggest that these alterations correlate with disease severity; thus, studies on exogenous surfactant therapy and on the effect on surfactant metabolism are needed.
Aspiration of gastric (acid) content is a major cause of acute respiratory failure that occurs in children with severe gastroesophageal reflux, gastrointestinal malformations, and neurologic impairment. Alveolar surfactant alterations were demonstrated in diseases with similar aetiology like ARDS and meconium aspiration syndrome. To understand if the surfactant system is modulated locally or if an unilateral injury influences both lungs, we measured alveolar surfactant DSPC in a murine model of unilateral acid injury.

We developed a mouse model of acid lung injury confined in a single lung (right). Deuterated water was injected 18 h after the lung injury and DSPC-palmitate deuterium enrichment was measured for the next 24 hours in BAL and tissue. MPO and total protein analysis was performed separately to each lung to assess the inflammatory status.

Inflammatory status of both lungs was markedly increased in the injured (right) lung. DSPC content was not significantly different between the two lungs in tissue homogenates at all time points (1.8±0.3 vs. 1.7±0.6 umol/g of lung). Conversely, DSPC content in BAL was significantly increased in the not-injured lung (1.00±0.36 vs. 1.49±0.5 umol/g of lung, p=0.008). Fractional synthetic rates did not significantly change in both homogenates and BAL between the two lungs.

These preliminary data suggest that surfactant system is likely to be regulated at the whole lung level. The not-injured lung seems to increase the amount of DSPC in the alveolar space as a compensatory mechanism for the damage in the contralateral lung.

Clinical Effectiveness of Early Administration of Caffeine and Low-Dose Hydrocortisone to Preterm Newborns with a High Risk of BPD Development

doi:10.1136/archdischild-2012-302724.0405

D Dobrynaskyy, O Borysiuk, Z Salibay, Y Dubrova.

Because intrauterine and/or early postnatal inflammation play(s) an important role in the pathogenesis of bronchopulmonary dysplasia (BPD) early administration of anti-inflammatory therapy to high-risk preterm newborns is theoretically substantiated. In a randomised study we evaluated the clinical effectiveness of early administration of caffeine and hydrocortisone to very preterm newborns that required mechanical ventilation (MV) shortly after birth.

Methods

120 very low birth weight newborns (gestational age <32 wks.) on MV were randomly assigned on the first day of life to one of the 2 groups depending on administration of caffeine and hydrocortisone. 60 infants with gestational age of 28.02 (1.9) wks. were treated with caffeine (20/5 mg/kg/day) and hydrocortisone (1 mg/kg/day) for 12 days. 60 babies with gestational age of 28.4 (1.8) wks. in the control group were managed according to standard guidelines. The primary study outcome was the incidence of mortality and BPD at 36 weeks’ corrected age. BPD was defined according to the NIH consensus definition in modification of Walsh et al. (2003).

Results

BPD developed in 19 (35%) infants treated with caffeine and hydrocortisone and in 20 (37%) babies from the control group (p=0.05). The composite outcomes (death plus BPD) (26 [43%] vs. 27 [45%]) accordingly; p=0.05) and incidences of severe BPD were not different between the groups either. Early anti-inflammatory therapy reliably facilitated extubation but did not reduce the duration of the initial period of MV.

Conclusions

Early administration of caffeine and hydrocortisone did not prevent BPD development in very preterm newborns requiring MV.

Is the Association Between Chorioamnionitis and Adverse Respiratory Outcomes a Myth in the Era of Antenatal Corticosteroids?

doi:10.1136/archdischild-2012-302724.0407

D Harding, A Howell, T Candler, P Plott.

Background and Aims

Chorioamnionitis has historically been associated with adverse neonatal respiratory outcomes. The outcomes of very low birthweight (VLBW) babies born in the UK with histological chorioamnionitis and treated with antenatal corticosteroids has not been examined. Our aim was to determine if there was an association between histological chorioamnionitis and adverse respiratory outcomes in our population of VLBW infants who received antenatal corticosteroids.

Methods

294 VLBW babies born between Jan 2001 and Dec 2010 who had received antenatal corticosteroids and had placental histology performed were identified. Infant characteristics and outcomes were as described by Vermont-Oxford. Analysis was performed using chi square, student t-test and logistic regression.

Results

97 babies out of 294 babies (33%) had histological chorioamnionitis (58 had funisitis). Chorioamnionitis was associated with ventilation 73 (85%) vs 117 (69%), p=0.006, surfactant 72 (84%) vs. 112 (66%), p=0.003, RDS 75 (87%) vs 120 (71%), p=0.004, Steroids for CLD 6 (7%) vs 11 (7%) p=0.788. All discharges on O2 (transfers & home 02) 44 (51%) vs 57 (38%), p=0.007. Chorioamnionitis was associated with the need for oxygen at 36 weeks (52% vs 31%, OR 2.4, p=0.015). However the group of infants with chorioamnionitis were
