preventive strategies should be initiated to curb this rising prevalence of allergies.

450 WHAT DO CHILDREN WITH CONGENITAL HEART DISEASES DO WHEN THEY GROW UP

doi:10.1136/archdischild-2012-302724.0450

SC Antoniadis, A Antoniadou, O Panajiotopoulou, E Miloperi, P Kleanthous, E Dionysopoulou. Diagnostic Center for Pediatric Cardiology, Athínaí, Greece

Background Advances in the diagnosis and interventional-surgical management of congenital heart diseases had as a result a considerable number of patients reaching the adolescent and young adult life.

Aims The aim of this study was to investigate the influence of the heart problem on the psychosocial-sexual and family life, careers and employment rate of patients with congenital heart disease.

Methods We studied according to a protocol with a closed questionnaire as well as the medical files of 441 children with congenital heart diseases.

Results From the 158 male patients aged 15–35 years, 98 (62%) had simple heart lesions, 21 (13.5%) combinations of simple heart lesions and 39 (24.7%) complex heart problems, 93 (59%) had surgical-interventional management. Between them 130 (82.2%) had no psychosocial-sexual problems related with age, whereas 13 (8.3%) with complex heart lesions had not normal social and sexual life. From the 146 female patients aged 14–32 years, 93 (63.7%) had simple lesions, 25 (17.12%) combinations of simple heart lesions, and 28 (19.17%) complex heart problems, 56 (38.3%) had surgical-interventional management. From them 136 (93.15%) had no problems related with age whereas 10 (6.85%) had, from the 23 pregnancies, 10 (43.5%) operated mothers, 21 (91.3%) babies born without problems. From the 114 patients studied for their careers and employment rate, 59 (59.8%) were high school graduates, 43 (37.7%) university graduates, 9 (7.9%) technical school graduates, and 11 (9.6%) couldn’t work because of the heart problem.

Conclusions Simple heart lesions and their combinations doesn’t cause specific problems whereas complex heart diseases, especially if the result of the operation is not the expected one, cause.

451 THE EFFECT OF PRETERM BIRTH ON ATTENTIONAL NETWORKS IN ADULTS

doi:10.1136/archdischild-2012-302724.0451

A von Muhlenen, N Baumann, D Wolke. University of Warwick, Coventry, UK

Background Preterm birth has been associated with an increased risk of cognitive, behavioral and psychiatric problems. In this study we examine how these problems are linked to specific attentional networks.

Methods Based on a sample from the Bavarian Longitudinal Study we compared a cohort of 97 survivors born very preterm (<32 weeks gestational age, GA) or very-low-birth-weight (VLBW <1500g) in 1985/86 (mean birth weight, 1318g; mean GA at birth, 30.2 weeks; 52% male) with 109 controls from the same population in Bavaria (mean birth weight, 3414g; mean GA at birth, 39.7 weeks; 48% male). We looked at performance in the attention network test, developed by Fan et al. (2002, Journal of Cognitive Neuroscience), in three anatomically defined attentional networks: alerting, orienting and executive control.

Results The figure shows the RT index, representing efficiency for each attentional network. The VLBW group showed a large and highly significant deficit in the executive network and a smaller but significant deficit in the orienting network, but no deficit in the alerting network. Although RTs were generally longer for VLBW, the RT index result did not change when using RT ratio scores.

452 ASSOCIATIONS BETWEEN BEHAVIORAL AND SLEEPING DISORDERS IN PRETERM CHILDREN TO CATCH UP IN HEIGHT AND WEIGHT

doi:10.1136/archdischild-2012-302724.0452

E Deschman, M Vanpee, L Legnevall, A Kistner. 1Inst of Women and Child Health; 2Inst of Molecular Medicine and Surgery, Stockholm, Sweden

Aim To study an association between sleep (SP) and behavioral disorders (BP) in preterm children to catch-up growth and weight.

Design and Methods 105 children (8.5–10 years): 39 born preterm (<32 weeks), at term 30 born SGA and 36 born AGA (Controls) were studied. Eight Preterms were born SGA and 31 were born AGA. BP was defined as hyperactivity and concentration problems, SP as hard to fall asleep and wakening during night. Pearson Chi-Square or Student t-test were used.

Results The Preterm group displayed a higher incidence of SP (23% vs 10% and 3% p=0.026) and BP (38% vs 10% and 8%, p=0.001).

Abstract 451 Figure 1 RT Index

Conclusions The results show that VLBW is linked to specific attentional deficiencies, especially those involving executive control. These results are discussed in the light of the literature on VLBW and attention.

Abstract 452 Figure 1 BP in relation to catch up growth

○ Preterm AGA no BP • Preterm AGA with BP ◇ Control no BP
The black dotted line: Controls without BP (r=0.69, p<0.0001). The solid line: Preterm AGA without BP (r=0.38, p=0.11), the red dotted: preterms AGA with BP (r=0.06, p=NS).

At 9 years, preterm AGA with BP (n=13) had lower height SDS (p=0.005), weight SDS (p=0.006) and head circumference SDS and a tendency to lower height catch-up (p=0.09) compared to preterm AGA without BP (n=18). Fasting levels of IGF-I, insulin and leptin were lower in all Preterms with BP.

Preterms with SP (n=8) had a lower height catch-up (p=0.009) compared to those without SP (n=30).

Conclusion Children born preterm have an increased risk for SP and BP. These disorders are associated with reduced catch up in height.

453 REPEAT COURSES OF ANTENATAL CORTICOSTEROIDS FOR PRETERM BIRTH AND RISK FOR METABOLIC SYNDROME IN YOUNG ADULTHOOD
doi:10.1136/archdischild-2012-302724.0453

Background Preterm birth is associated with later hypertension and diabetes. One explanation for this association could be that exposure to antenatal corticosteroids (ACS), especially if repeated, induce adverse long-term effects. There are no data on whether repeat courses of ACS are associated with health problems later in life. The aim of this study was to assess whether repeat courses of ACS correlate to metabolic syndrome later in life.

Methods In a population-based cohort we measured BMI, blood pressure, arterial stiffness, blood lipids and glucose tolerance in 58 subjects (36 boys, age 14 to 26 years) exposed to 2–9 weekly courses of antenatal betamethasone. Subjects exposed to a single course (n=25, 14 boys) and unexposed subjects (n=44, 25 boys) were included as comparison groups.

Results As compared to unexposed controls, subjects exposed to repeat courses of ACS did not differ in BMI (mean difference 0.6kg/m², p=0.5), mean systolic or diastolic blood pressure (mean diff 1mmHg, p=0.78–0.83), arterial stiffness assessed by pulse wave analysis (mean diff 0.1%, p=0.5), triglyceride (mean diff 0.1mmol/L), total cholesterol (mean diff 0.0mmol/L), LDL/HDL ratio (mean diff 0.1), Lipoprotein(a) (mean diff 0.0mg/L), ApolipoproteinB/ApolipoproteinA1 ratio (mean diff 0.01), (p=0.33–0.91) or glucose tolerance assessed by HOMA-index (mean diff 0.1), Lipoprotein(a) (mean diff. 61mg/L), Apolipopro-

455 IMPROVEMENT OF SERUM TESTOSTERONE IN DIABETIC RATS TREATED WITH METFORMIN AND NIGELLA SATIVA
doi:10.1136/archdischild-2012-302724.0455

A Abd ElShaheed, KA El-Shamy, TH Mekhael, A Boulos, SE Ibrahim, NN Fadi. ‘Child Health; ‘Physiology; ‘Pathology, National Research Centre; ‘Zoology Department, Faculty of Science, Cairo University, Cairo, Egypt

Background and Aims To evaluate the effect of metformin and Nigella sativa (alone or in combination) on improving the diabetic state of rats.

Methods Male Sprague-Dawley rats weighing 180–200g had induced diabetes using alloxan (150 mg/kg), then diabetic rats were treated daily for 45 days with metformin (0.5g/Kg.b.wt), Nigella sativa (1g/Kg.b.wt) or a mixture of metformin + Nigella sativa (0.25g+1g/Kg.b.wt) in a separated three groups and compared with a group of alloxanized diabetic rats as control. HbA1c, serum glucose, lipid profile, microalbuminuria (MA), ALT, AST, insulin, SHBG and total testosterone were measured using ELISA & spectrophotometer techniques, tests and liver tissue were examined histopathologically.

Results Both metformin and Nigella sativa were comparable in reducing serum glucose of the diabetic rats, furthermore, Nigella sativa showed a hypolipidaemic effect and it also improved liver functions. The level of serum insulin was significantly increased (P<0.05) in three groups. Importantly, using the mixture of metformin and N.sativa was less effective in improving diabetic state than using metformin or N.sativa alone, although it had improved serum level of testosterone and normalized the structure of testis.

Conclusion Using either metformin or Nigella sativa alone was more effective in improving the diabetic state of rats than using them in combination, although this combination was more effective in improving both serum level of testosterone and the structure of testis. This raise basic questions about the effect of interactions that may occur on using this mixture in the treatment of diabetes that necessitate further studies.
