pain on right side. Blood exams showed rise of CRP (19 mg/L) and normal WBC. An ultrasound performed in the A&E department was normal. Because of the persistence of pain, we repeated an ultrasound the day after that showed an anechoic uniloculated 18 mm cyst at the level of the right ovary. The report was of functional follicular cyst.

After two days of observation and worsening of the symptoms, laparoscopy was performed: a necrosis of the fimbriae due to torsion at the right fallopian tube infundibulum was found. The ischaemic fimbriae were removed according to Kroener fimbriectomy. Hystero-
logical analysis described fimbriae characterized by oedema and vas-
cular congestion.

Discussion Torsion of infundibulum could mimic a functional annexial cyst, with a normal echogenic appearance, while a torsion of the whole Fallopian tube can be more easily detected and sus-
pected, avoiding delayed treatment. In our case, to base the manage-
ment on clinical symptoms was mandatory.

Conclusions Isolated torsion of infundibulum of Fallopian tube is a challenging diagnosis. It should be considered in case of acute lower abdominal pain in young girls. Early laparoscopy seems to be the best approach for diagnosis and treatment.

OSTEOLYTIC LESIONS OF THE CALCANEUS IN PAEDIATRIC PATIENTS: RESULTS FROM A MULTICENTER STUDY
doi:10.1136/archdischild-2012-302724.0464

1AFrings, 2DAndreou, 3FMachacek, 4BFieglAtzwanger, 5MZachler, 6RLWindhager, 7ALeithner. 1Medical University of Graz, Graz, Austria; 2HELIOS Klinikum Berlin-Buch, Berlin, Germany; 3Orthopaedic Hospital Gersthof, Vienna, Austria; 4Institute of Pathology, Medical University of Graz; 5Department of Orthopaedics, Medical University of Graz, Graz; 6Department of Orthopaedics, Medical University of Vienna, Vienna, Austria

Tumours of the calcaneus are exceedingly rare. X-rays are the standard examination tool and therefore we wanted to evaluate if X-rays alone were sufficient for proper diagnosis. Diard’s classification was applied to define whether different types of lesions were characteristically distributed in the bone and in addition we ana-
lyzed whether type and/or duration of symptoms were possible indicators of malignancy.

Sixteen patients (12 male, 4 female; mean age 15 years, range 8 to 20) were identified. The definitive diagnosis was simple bone cyst (n=10), aneurysmatic bone cyst (n=3), intraosseous lipoma (n=1) and Ewing’s Sarcoma (n=3), intraosseous lipoma (n=10), aneurysmatic bone cyst (n=20) were identified. The definitive diagnosis was simple bone cyst

Discussion Discrepancies of the radiological and definitive diagnosis occurred in four of 16 cases. Applying Diard’s system trabecular area number 6 was affected in 14 of 16 cases. We did not observe local recurrence for benign lesions.

In each case of an osteolytic lesion of the calcaneus a malignant tumor must be ruled out and thus, plain X-rays in two planes alone are not sufficient and should therefore be followed by MRI. Applying the Diard system different types of lesions are not characteristi-
cally distributed in the bone. Increasing pain without previous trauma should always justify further examinations.

SOCIAL INEQUALITIES IN ADOLESCENT HEALTH
doi:10.1136/archdischild-2012-302724.0466

Objectives To investigate how socioeconomic indicators and indi-
vidual variables from woman, pregnancy and delivery, can interact to influence rates of adolescent pregnancy in South Brazil.

Methods Information from the Live Birth National Information System (SINASC), concerning 419,272 deliveries taking place in the State of Santa Catarina, South Brazil, from 2003 to 2007 were analysed. The study combined ecological and cross-sectional meth-
ods of data collection and analysis. Correlations between socioeco-
nomic indicators and rates of adolescent pregnancy were obtained. Annual rates and crude and adjusted rates, using Cox Regression, were calculated for literacy, ethnicity, duration of pregnancy and frequency to antenatal care consultations.

Results Rates of adolescent pregnancy for the 293 states of Santa Catarina in the study period was 18.26% decreasing linearly from 2003 to 2007 were analysed. The study combined ecological and cross-sectional meth-
ods of data collection and analysis. Correlations between socioeco-
nomic indicators and rates of adolescent pregnancy were obtained. Annual rates and crude and adjusted rates, using Cox Regression, were calculated for literacy, ethnicity, duration of pregnancy and frequency to antenatal care consultations.

Conclusion Prevalence of moderate to severe PMS was 17.3% and PMDD was 4.7%. 95.0% girls had at least one PMS symptom, 68.8% had at least one moderate to severe PMS symptom, 49.9% had one or more physical symptoms and 89.8% had more than one PMS symptom. 37.1% had disruption of daily activities while 24.2% remained absent from school/college due to PMS. 75.4% girls felt that PMS was a normal part of menstruation and 50.0% reported moderate to severe stress. 21.4% had physical symptoms every menstrual cycle. Age, weight, BMI, stress level, dysmenorrhoea and menstruation contribute significantly to PMS, whereas menstru-

Background and Aims Premenstrual syndrome (PMS) disrupts lives of girls who otherwise would lead more productive lives. We assessed prevalence and severity of PMS in adolescents of Anand, a small town in western India and identified probable associations with age, locality, food habits, obesity, stress, genetic influence, menstruation and dysmenorrhoea.

Methods Cross sectional observational study in which Premenstrual Symptoms Screening Tool for Adolescents (PSST-A) ques-
tionnaire was self-administered to screen PMS and Premenstrual Dysphoric Disorder (PMDD). 1385 girls of Gujarati ethnicity in age group 10 to 23 years with regular menstrual cycles participated. Obesity was assessed through Body Mass Index. Results were examined for associations that could indicate effect of lifestyle on PMS/PMDD.

Results The prevalence of moderate to severe PMS was 17.3% and PMDD was 4.7%. 95.0% girls had at least one PMS symptom, 68.8% had at least one moderate to severe PMS symptom, 49.9% had one or more physical symptoms and 89.8% had more than one PMS symptom. 37.1% had disruption of daily activities while 24.2% remained absent from school/college due to PMS. 75.4% girls felt that PMS was a normal part of menstruation and 50.0% reported moderate to severe stress. 21.4% had physical symptoms every menstrual cycle. Age, weight, BMI, stress level, dysmenorrhoea and menstruation contribute significantly to PMS, whereas menstru-

Conclusion Prevalence of moderate to severe PMS and PMDD in this population is higher than reported elsewhere. PMS interferes with day to day life significantly.
