Objectives There is not yet a general consensus about the diagnosis of left ventricular noncompaction. The echocardiographer may miss the areas with maximal noncompaction leading to a misdiagnosis. Accordingly, we suggested a new method to measure the percentage of myocardial hypertrabeculation/noncompaction using two-dimensional echocardiography.

Patients In this study, this new method was examined on 3 non-compaction, 26 dilated cardiomyopathy, and 25 normal subjects.

Results The mean percentages of myocardial hypertrabeculation/noncompaction were 3.59 ± 2.27 in control group, 8.86 ± 5.52 in dilated cardiomyopathic patients, and 38.1 ± 30.8 in noncompaction patients. A value of 16% could distinguish left ventricular noncompaction from dilated cardiomyopathy with 92% specificity and 100% sensitivity and from normal subjects with 100% specificity and sensitivity. This percentage had a statistically significant association with noncompacted to compacted myocardial thickness ratio ($P < 0.001$).

Key Conclusions This method showed good correlations with the other echocardiographic and magnetic resonance criteria. However, it is not dependent on finding the area of maximal involvement.

508 REGIONAL CARDIAC NETWORKS: CAN THEY WORK?

doi:10.1136/archdischild-2012-302724.0508

Background Only eleven paediatric intensive care units (PICUs) in UK have cardiac surgical services on-site. Small proportion of patients admitted to non-cardiac surgical PICUs require transport to surgical centres. North West and North Wales Paediatric Transport service (NWTs) provides PIC transport service, including ability to conference call specialists. Alder Hey Children's hospital (AHCH) is the cardiac surgical centre and Royal Manchester Children's hospital (RMCH) only has cardiology on site.

Methods Retrospective review suspected cardiac cases transferred in 12 months:- assessing if time critical surgical patients underwent single transfer to surgical centre- interventions by referring hospital or NWTs.

Results Total 29 patients of suspected cardiac diagnosis.

Abstract 508 Graph 1

Abstract 508 Table 1 Interventions

INTERVENTIONS	REFERRING HOSPITAL	NWTS
Intubation	22	4
Central Venous Access	6	7
Dinoprostone (PGE2)	20	2
Inotropes	7	10
Inhaled Nitric oxide	0	3

Seven patients had time critical cardiac surgical lesions. One patient required a second immediate transfer to surgical centre. Retrospectively, this could have been predicted from clinical picture. 68% patients had dinoprostone started by referring team following advice from cardiologist or NWTs. Inotropes initiated on advice or by NWTs.

Conclusions Regional cardiac network can work effectively with improved communication particularly in acute scenario. Potential surgical cases may be predicted from clinical picture, especially if not resolving with full medical treatment.

509 PREVALENCE OF SIDEROPEMIC ANEMIA IN CHILDREN WITH CONGENITAL HEART DISEASE LESS THAN ONE YEAR IN COMPARISON WITH HEALTHY CHILDREN

doi:10.1136/archdischild-2012-302724.0509

Introduction Syderopenic anemia is prevalent in all children with congenital heart disease, especially in children with signs of heart failure.

Objectives The purpose of this study is to determine the prevalence of sideropenic anemia in children with CHD and compares these results with data of health children less than one year in Kosova population.

Methodology Between 2000 and 2010 4236 children were evaluated retrospectively clinically and by echocardiography for congestive heart failure (CHF) caused by CHD. CHD was diagnosed in 832 patients (19.6%) while 78 patients (1.84%). Also from the study have been exclude children with complex CHD caused central cyanosis. In all patients were analyzed heart failure symptoms, hemoglobin levels, age of diagnosis, duration of hospitalization per year and death during medical attendance.

Results Anemia was present in 78% of children with CHD, and in 85% children with CHF. Hospitalization days per year in anemic patients had a significantly higher than in non-anemic patients (mean 32.5 ± 39.6 days per year versus 12.3 ± 14.3 days per year ($p < 0.05$). There was not found significant relation onset of heart failure symptoms and the risk of developing anemia between anemic and non-anemic patients. The evaluation showed also needed for the two times longer period of the treatment of patients with CHD with antianemic medication in compare with healthy anemic children.

Conclusion Anemia is prevalent in pediatric patients with CHD especially patients with heart failure. Study showed no higher mortality in anemic patients.

510 A NOVEL MYH7 VARIANT IDENTIFIED IN A CHILD WITH RESTRICTIVE CARDIOMYOPATHY

doi:10.1136/archdischild-2012-302724.0510
