The study group was divided into three subgroups according to gestational weeks (<28 wk, n=79; 28–31 6/7 wk, n=204; 32–33 6/7 wk, n=145). Twenty-five percent of the infants were small for gestational age (SGA). Mean age at first thyroid function evaluation was 18.3±12.5 days. Mean FT4 levels were 12.0±3.1, 14.1±3.3 and 17.7±3.9 pmol/L in three subgroups, respectively and significantly lower in infants <28 weeks. In all subgroups SGA infants had lower FT4 levels, but it was significantly lower in only 28–31 6/7 and 32–33 6/7 weeks but not in <28 weeks subgroup. Overall, the prevalence of hypothyroxinemia and hypothyroidism were 25% and 0.8%, respectively in the first evaluation. 17.6% of infants <28 weeks had hypothyroxinemia (n=135) and all of them were treated. In the total group levothyroxine treatment was given to 51 (11.9%) infants. Mean treatment period was 1.6±1.2 years.

**Conclusion** Free T4 levels were lower in the early gestational age subgroups. SGA infants had lower FT4 levels.

**652** **PREVALENCE OF SENSORINEURAL HEARING LOSS IN PATIENTS WITH CONGENITAL HYPOTHYROIDISM**

Methods All patients afflicted with congenital hypothyroidism identified in the screening program (in Qazvin, Iran) were enrolled in this study. They were both under observed and hormonal replacement therapy by referral Endocrine Diseases Clinic and auditory brainstem responses test (ABR) was performed for all subjects.

Results Of 169 patients with congenital hypothyroidism, 42.3% were diagnosed through neonatal screening program. Nor with other variables of the study. Normal sensorineural hearing can be maintained with pertinent replacement therapy.

**655** **GENDER PECULIARITIES OF THE COURSE OF GRAVES-BASEDOW DISEASE IN CHILDREN**

Background Human growth is a continuous process. Studies defining placentation effect on growth focus on discrete time points (e.g., birth), overlooking the conditional nature of the process.

Material and Methods Two hundred mothers who gave birth at term after an uncomplicated singleton pregnancy were studied using conditional analysis. Placental weight, infant length (BL), weight (BW), and head circumference (HC) were obtained at birth and during childhood period (4.5–2.2 years) of age. Placental weight was correlated with growth parameters of the child at birth and during childhood.
Conclusion

The changes in this parameter was not different between the two trimesters compared with other trimesters (ΔLG: first trimester trend was also observed regarding changes in linear growth that the third trimester was significantly higher than other time intervals (increase in weight velocity within first and third trimesters were less of gender. More pronounced features of laboratory thyrotoxicosis in boys can say about late diagnostic. Normalization of free T4 was after 6 months treatment in 66.7% children.

Conclusions

GBD more often manifested in late puberty regardless of gender. More pronounced features of laboratory thyrotoxicosis in boys can say about late diagnostic. Normalization of free T4 was after 6 months treatment in 66.7% children.

ENHANCEMENT OF LINEAR GROWTH AND WEIGHT VELOCITY BY CYPROHEPTADINE IN CHILDREN WITH IDIOPATHIC GROWTH HORMONE DEFICIENCY RECEIVING THIS HORMONE

doi:10.1136/archdischild-2012-302724.0656

KS Najibi, Z Karamizadeh. Shiraz University of Medical Sciences, Shiraz, Iran

Background The current study examined the hypothesis that Cyproheptadine can enhance linear growth and increase weight velocity in children with idiopathic GH deficiency.

Method 10 children with idiopathic GH deficiency received Cyproheptadine 0.8mg/kg three times per week plus GH0.6U/kg/day for six days a week for 1-year period, alternatively (GH plus Cyproheptadine for first and third trimesters, and GH plus placebo for second and fourth trimesters). Weight velocity and linear growth were assessed at baseline and end of every trimester.

Result The repeated measure ANOVA test showed significant differences in weight velocity across the study trimesters so that the increase in weight velocity within first and third trimesters were significantly higher than other time intervals (ΔVV, first trimester 1.51±0.11kg; second trimester 1.13±0.16 kg, third trimester 1.87±0.65kg; and fourth trimester 0.74±0.34 kg, p=0.026). Similar trend was also observed regarding changes in linear growth that the increase in children height was significantly higher in first and third trimesters compared with other trimesters (ΔLG: first trimester 2.40±0.39cm; second trimester 1.65±0.41cm, third trimester 2.00±0.88kg; and fourth trimester 1.30±0.48 kg, p=0.029). The standard deviation of linear growth was gradually decreased during the study trimesters (4.7, 4.50, 4.25, and 3.88cm, respectively, however the changes in this parameter was not different between the two drug regimens.

Conclusion Our study showed improved linear growth and weight velocity following administration of Cyproheptadine in children given GH because of their GH deficiency.

THE ROLE OF GROWTH HORMONE IN BONE MATURATION: EVALUATION BY HAND X-RAY

doi:10.1136/archdischild-2012-302724.0657

I Even, Z Hochberg. 1Pediatrics, Bar Ilan Western Galilee Hospital, Naharia; 2Technion, Haifa, Israel

The maturation of the long bones and short bones of the hand differs from the carpal bones. We aimed to determine role of GH. Bone age x-ray was performed in 12 children with GHD, 19 ISS children age 5.8 ±0.9 (mzsd) during 3 y of hGH treatment and 12 untreated ISS children. Individual bones were evaluated by a single blinded observer according to Greulich and Pyle, and are expressed as ‘years’ (y) of delay relative to chronological age. In ISS, maturation was delayed by 1.87±0.3, 2.07±0.25 and 1.75±0.2 ‘y’ for RU, C and S bones, resp. In GHD, maturation was delayed by 3.1±0.4, 4.5±0.2 and 2.9±0.4 ‘y’ for RU, C and S bones, resp. In ISS over 3 y of GH treatment, RU advanced by a mean 3.5±0.4 ‘y’, as compared with untreated 3.3±0.7 ‘y’ (p<0.10), C advanced by a mean 4.2±0.7 ‘y’ on hGH and 3.3±0.6 ‘y’, in control (p<0.001), and S bones by a mean 3.5±0.9 ‘y’ on hGH and 3.1±0.7 ‘y’ in control (p<0.058). In GHD over 3 y of GH treatment, RU advanced by a mean 3.1±0.4 ‘y’, (p<0.10), C advanced by a mean 4.3±0.2 ‘y’ (p<0.001), and S bones 2.9±0.1 (p<0.06).

These results suggest that GH strongly regulates and GHD interferes with bone maturation by inhibiting chondral osteogenesis and less so through delayed enchondroplasia, observed by RU and S maturation. These profiles help in the diagnosis of GHD.

CONGENITAL ANOMALIES IN INFANTS WITH CONGENITAL HYPOPTHYROIDISM IN QAZVIN, IRAN

doi:10.1136/archdischild-2012-302724.0658

1F Saffari, 2Y Melikian. 1Pediatrics, Qazvin University of Medical Sciences, Qazvin, Iran

Background and Aims In the last decade a high frequency of extrathyroidal congenital anomalies has been reported in infants with congenital hypothyroidism detected by neonatal screening. Approximately 10% of infants with congenital hypothyroidism have associated congenital anomalies. Cardiac anomalies are most common, but anomalies of the nervous system and eye have also been reported. The main objective of this study was identification of associated disorders in patients with congenital hypothyroidism.

Methods This descriptive study was performed on newborns with congenital hypothyroidism that had been diagnosed by screening in Qazvin province of Iran from 1388 to 1390. Variables were analyzed by Chi-square test.

Results In the screening 287 newborns with congenital hypothyroidism were diagnosed –122 female (42.2%). 36 (12.5%) of 287 patients had congenital anomalies. 10 (3.5%) Down syndrome, 10 (3.5%) cardiovascular anomalies, 9 (3.1%) hearing disorder, 2 (0.7%) eye disorder, 2 (0.7%) retinopathy, 2 (0.7%) disorder of face and ear, 2 (0.7%) CNS disorder, one (0.3%) CAH, one (0.3%) panhypopituitarism and one (0.3%) pseudohypoparathyroidism were diagnosed.

Conclusions With respect to the association of congenital anomalies with congenital hypothyroidism, every newborn with congenital hypothyroidism should be carefully examined for cardiovascular disorders and other related anomalies.

HYPOPARATHYROIDISM AND PSEUDOHYPOPARATHYROIDISM: ABOUT 9 CASES

doi:10.1136/archdischild-2012-302724.0659

I Maaloul, S Khmka, L Sfaihi, I Chabchoub, S Ben Ameur, H Alolou, T Kamoun, M Hachicha. Pediatric Department, Hedi Chaker Hospital, Sfax, Tunisia

Introduction Hypoparathyroidism(HP) is an uncommon disorder of calcium metabolism characterized by hypocalcemia and hyperphosphatemia due to impaired parathyroid hormone (PTH) secretion. The pseudo-hypoparathyroidism(PHP) is characterized by a high level of PTH due to peripheral PTH resistance.

Objective Describe clinical, biochemical, radiological profile, treatment and outcome in 9 patients with HP and PHP seen over a period of 24 years.

Methods This study was performed in the pediatric department of Sfax during 24 years (from January 1988 to April 2012). The diagnosis of HP and PHP was based on demonstration of hypocalcemia, hyperphosphatemia with low or elevated PTH, respectively.

Results During the period of study, 9 children having HP or PHP were admitted. There were 5 girls and 4 boys. The mean age at presentation was 44 months (15 days– 10 years). The most common presenting manifestation was seizures (8cases) followed by carpopedal spasm in one case. The mean serum calcium and inorganic phosphate concentrations were 1, 51 mmol/l and 3 mmol/l,
