Results It is established that the nephroblastoma increases blood flow to the main artery of the affected kidney compared with the contralateral (p=0.00003). According to our data the volume of the affected organ with nephroblastoma correlated with blood flow in the main artery (r=0.45; p<0.05). Such dependence can reflect the pathological circulation of the affected kidney. It also reflects the need to change the absolute amount of blood flow in tumor growth. At the same time in a healthy kidney specific blood flow much higher than that of the affected (p=0.00001). Indices of relative blood flow affected and contralateral kidneys were 1.32 (1.04–2.13) ml/cm²/min and 5.46 (3.73–6.78) ml/cm²/min, respectively.

Conclusions Thus, the hemodynamic characteristics the affected of nephroblastoma kidney were studied. Specific blood flow of affected organ with a continuous functional activity is significantly less with respect to the contralateral (not affected). These data may prove useful in the development of differential diagnostic criteria for distinguishing nephroblastoma and adrenal neuroblastoma at the stage of diagnosis.

### Abstract 779

**BLOOD PRESSURE AND HEART RATE DO NOT REFLECT CARDIAC OUTPUT IN CRITICALLY ILL CHILDREN**

doi:10.1136/archdischild-2012-302724.0779

A Nusmeier, PJ Gooskens, JG van der Hoeven, J Lemson. Intensive Care, Radboud University Nijmegen Medical Center, Nijmegen; Technical Medicine, University of Twente, Enschede, The Netherlands

**Introduction** Treatment to support the circulatory state is often based on the interpretation of clinical parameters while advanced hemodynamic monitoring is not always available or applied in children. Cardiac output (CO) measurement using the transpulmonary thermodilution (TFTD) technique is the gold standard in pediatric patients. We studied the predictive value of clinical parameters of (changes in) CO by comparing the blood pressure and heart rate values with intermittent CO TFTD measurements.

**Methods** A retrospective observational study was performed in a heterogenic critically ill patient population. Doses of inotropics, if administered, was registered to study their influence on CO. We studied the predictive value of clinical parameters of (changes in) CO by comparing the blood pressure and heart rate values with intermittent CO TFTD measurements.

**Results** 216 CO measurements in 20 patients were analyzed. Median age was 1.7 (range 0.3–5.2) years and median body weight 8.8 (range 3.8–18) kg. The median CO was 1.88 (range 0.61–5.64)l/min and 5.46 (3.73–6.78) ml/cm²/min, respectively.

**Conclusions** Thus, the hemodynamic characteristics the affected of nephroblastoma kidney were studied. Specific blood flow of affected organ with a continuous functional activity is significantly less with respect to the contralateral (not affected). These data may prove useful in the development of differential diagnostic criteria for distinguishing nephroblastoma and adrenal neuroblastoma at the stage of diagnosis.

### Abstract 778

**BILATERAL RENAL ARTERY STENOSIS AND EPIDERMAL NEVUS SYNDROME IN A CHILD**

doi:10.1136/archdischild-2012-302724.0780

F Alshime. Pediatric Nephrology, Hospital Femme Mere Enfant, Lyon, France

Epidermal nevus syndrome is a rare congenital sporadic neuro-ectoderm disorder, characterized by the presence of epidermal nevi in association with various developmental abnormalities of the skin, eyes, nervous, skeletal, cardiovascular and urogenital systems. We describe a 5-year-old boy with conjunctival lipodermoid, celiac and facial sebaceous nevi who presented at 3 years of age with hypertension due to bilateral renal artery stenosis together with multiple vascular anomalies (aorta, celiac trunk, superior mesenteric artery) as shown by magnetic resonance angiography. Systemic arterial hypertension was difficult to control despite combined anti-hypertensive drugs and the surgical repair of the aortic coarctation.

### Abstract 781

**SEEKING FOR DEFINITIONS OF POOR PERFUSION STATES (PPS) IN LOW BIRTH WEIGHT INFANTS (LBWI) (PART II)**

doi:10.1136/archdischild-2012-302724.0781

MC Bravo, P López-Ortego, J L Sánchez, J J Bierla, F Cabañas, E Pérez-Fernández, J J Quero, A Pellicer. La Paz University Hospital, Department of Neonatology; Biomedical Engineer and Nanotechnology Department, Polytechnic University of Madrid; Division of Statistics, La Paz University Hospital, Madrid, Spain

**Background and Aims** No validated scoring system to diagnose PPS in LBWI is available. Echocardiography (Echo)-derived low superior vena cava flow (SVCF) is a biomarker of PPS in this population as associates adverse outcome. We examined the ability of clinical surrogates of low systemic blood flow to indicate PPS as defined by low SVCF.

**Methods** One hundred LBWI [27.4 (2) wks; 1014 (316) g] who reached disease score below threshold, underwent early (<12h) and serial Echo scans during the first 96h after birth. Mean blood pressure (MBP), lactate, base excess (BE), core-to-peripheral temperature gap (DT) and diuresis were registered at the time of Echo assessment. N-terminal probrain natriuretic peptide (NT-proBNP) and troponine were measured within 24h and at postnatal day 4.

**Results** No association between SVCF and MBP, lactate, BE, DT, diuresis or troponine was found. NT-proBNP was inversely related to SVCF (p=0.006). Low SVCF (<41 ml/kg/min) was present in the first Echo (4.2h) in 27 patients. At that time, the sensitivity and specificity of the clinical parameters to predict low SVCF was, respectively: lactate > 4.5 mmol/L (22.2%; 89.4%); BE < -9 (6.9%; 92.9%); MBP<30 mmHg (25%; 64.6%); DT (15%; 78.8%). Combination of lactate and BE did not improve accuracy.

**Conclusions** PPS is a common condition early after birth in the sick LBWI. The role of Echo-derived systemic blood flow assessment to identify PPS cannot be replaced by clinical assessment solely.

### Abstract 782

**NEW DILUTION METHOD FOR QP/QS MEASUREMENT IN PATIENTS WITH SINGLE VENTRICLE (SV) ANATOMY**

doi:10.1136/archdischild-2012-302724.0782

N Krivitski, V Kislukhin, N Thuramalla, A Kriksunov. Transonic Systems Inc., Ithaca, NY, USA

**Background and Aims** Major challenge for treatment of Hypoplastic left heart syndrome by Norwood procedure is in achieving the adequate Qp/Qs value. The absence of routine method of assessing the Qp/Qs value can lead to hypoxia, brain injury, for Qp/Qs > 1 or to insufficient tissue perfusion and lung edema for Qp/Qs < 1. The aim of the study was to develop routine method for Qp/Qs assessment for PICU and NICU patients.

**Method development** A mathematical model of indicator movement for SV anatomy was developed. After intravenous injection and mixing in SV the first portion of the indicator enters systemic
