**Purpose** To determine risk factors (RF) and their relationship with life threatening infection (LTI) in children with febrile neutropenia (FN).

**Method** In this cross-sectional study, from December 2008 to November 2009, all children with FN admitted to Dr Sheikh Pediatric Hospital were enrolled. For each patient, demographic, clinical and laboratory data were recorded and they were followed up for occurrence of LTI.

**Results** 120 episodes of FN in 68 patients were analyzed. The most common underlying disease was Acute Lymphoblastic Leukemia (ALL) (53.3%), 9 (7.5%) died from an infection and 35 patients (29.1%) had a LTI. Five variables were identified as risk factors for LTI i.e. body temperature ≥39°C (p = 0.000), presence of mucositis (p = 0.000), abnormal chest x-ray (p = 0.001), platelet count less than 20000/mm³ (p = 0.001), and absolute neutrophil count less than 100/mm³ (p = 0.001).

Risk of LTI was increasing according to number of RFs presented at the beginning of admission (from 2.8% in patients without RF to 100% in patients with 5 RF).

Data mining analysis showed relationship between risk factors with platelet count as the most important variable in the high risk group for LTI.

**Conclusion** Evaluation of important RFs and judging the severity of patients’ condition by studying the importance and relationship between RF at the time of admission can be a useful method for screening LTI in children with FN.

**Fine Needle Aspiration Cytopathology of Pediatric Lymphadenopathy**

HG Ahmed. Pathology, College of Medicine, University of Hail, Hail, Saudi Arabia

**Background** Pediatric lymphadenopathy is a challenging medical situation for the patient, the parent, and the physician. Although the bulk of these masses will be benign the fear of malignancy is omnipresent. Therefore, the objective of this study was to identify the common causes of lymphadenopathy among Sudanese children.

**Methods** One hundred pediatric patients presenting with peripheral lymphadenopathy were included in the study, their ages ranging from 2 to 14 years, with a mean age of 7 years. Demographic characteristics, clinical manifestations and FNA materials were prospectively obtained.

**Results** FNA was performed under general anesthesia in 100 cases (100%). There were no technical complications. All cases confirmed adequacy of specimen. Overall, FNA demonstrated 90(90%) benign lesions and 10(10%) malignant diagnosis. The benign lesion was reactive lymphoid hyperplasia (n = 64), followed by benign granulomatous disease (n = 26). The 10 cases diagnosed with malignancy, 7 (70%) were cases of non-Hodgkin’s lymphoma and the remaining 3 (3%) were Hodgkin’s lymphoma cases.

**Conclusion** lymphoblastic leukemia can be suspected in pediatric patients with lymphadenopathy. FNA provides a useful tool in the diagnosis of pediatric patients with peripheral lymphadenopathy.

**A Rare, but Serious Side Effect of Methylphenidate**

S Damodaran, G Erumbala, O Abraham, L Doddaman. Paediatrics, James Paget Hospital, Great Yarmouth; PICU, Addenbrookes Hospital, Cambridge; Paediatrics, Milton Keynes General Hospital NHS Foundation Trust, Milton Keynes; Neonatal Unit, Birmingham Women's Hospital, Birmingham, UK

**Introduction** Anaemia, leucopenia and thrombocytopenia have been rarely reported in patients receiving methylphenidate. There is no recommendation for routine blood testing unless clinically indicated. We report two children who developed reversible neutropenia on treatment with methylphenidate.

**Method-case reports** Case 1: Routine blood test in a 14 year old boy with ADHD on Concerta XL 54 mg daily showed significant neutropenia (white cell count (WCC) - 3.1, neutrophil count - 0.8). The drug was discontinued following which WCC and neutrophil counts increased. Concerta was restarted but count started to decline after 2 weeks. Hence the drug was stopped. Since then, his counts have remained normal.

Case 2: Routine blood test in a 12 year old boy with ADHD on Concerta XL 36 mg and 10 mg of methylphenidate immediate release daily showed neutropenia (1.72). The count was further reduced to 1.55 after a month. There was no history of any viral infection during or immediately before this period. Neutrophil count normalised 1 month after stopping medication.

**Discussion** Methylphenidate is the most commonly prescribed stimulant for ADHD. There are wide variation in haematological...
