Conclusion The prevalence of VRE catheter-associated urinary tract infections among NICU patients and Pediatric ward has been rare in Tehran. PFGE results revealed that among *enterococci* isolates PFGE patterns were diverse.

PREVALENCE OF PANDEMIC (H1N1) AND SEASONAL INFLUENZA VIRUS INFECTION IN PEDIATRIC AGE GROUP IN SOUTHERN IRAN
doi:10.1136/archdischild-2012-302724.0877
A Moattari, A Emami. Bacteriology & Virology, Shiraz University of Medical Sciences, Shiraz, Iran

Background A novel strain of H1N1 Influenza (A/California/7/2009) has been prevalent since April 2009. Epidemiological and clinical studies showed that children at high risk for severe infection. Influenza virus infections are associated with significant morbidity and mortality in children with acute respiratory infections.

Aim To determined the prevalence of new H1N1 and seasonal influenza viruses in children with fever, cough, bronchiolitis, pneumonia, wheezing and asthma symptoms.

Methods Pharyngeal swabs were taken from 450 children aged (1–60 months) with respiratory tract symptom between June 2009 to March 2012. The specimens were tested using Real Time Reverse Transcriptase PCR.

Results Out of 480 samples 130 were tested positive for pandemic H1N1, 75 H3N2 and 15 influenza type B infections.

Conclusion According to our results 28.8% of respiratory infection in children in the south of Iran was due to new H1N1, 16.7% H3N2, 3.3% B Influenza viruses during the foregoing pandemic. Our analysis revealed no significant correlation between males and females.

THE PREVALENCE OF HUMAN BOCAVIRUS AND ADENOVIRUS IN HOSPITALIZED CHILDREN IN SHIRAZ-IRAN
doi:10.1136/archdischild-2012-302724.0878
A Emami, A Moattari, N Pirbonyeh. Bacteriology & Virology, Shiraz University of Medical Sciences, Shiraz, Iran

Background Acute respiratory infection is common cause of morbidity and mortality especially during childhood. The most important viral respiratory infection, such as: *Influenza viruses, Adenovirus, Respiratory syncytial virus* and *Bocaviruses* are the most common infections in upper and lower respiratory tract diseases. Different studies show Adenoviruses and *HBoV* are the most important potential respiratory pathogen after influenza virus with the same manifestations. *HBoV* in the parvovirus family first was detected in 2005 by molecular methods.

Aim In this study we tried to evaluate the prevalence of *HAdV* and *HBoV* in patients with respiratory tract infection.

Materials and Methods In this cross sectional study for two years (2009–2010), 150 nasopharyngeal swabs collected from youth age (≤15) with acute upper respiratory tract syndromes referring to the Shiraz University of Medical Hospitals. Adenoviruses were detected by nested-PCR and bocavirus was detected by usual conventional PCR with specific primers.

Results Among the 150 taken samples, 40 samples (27%) was positive for adenovirus and in 1 sample (0.66%) *HBoV* was amplified which was co-infected with adenovirus.

Conclusion The result of this study showed that Adenoviruses have more prevalence in south of Iran compare to influenza viruses during this two years, but Bocavirus has no more prevalence in this region between this groups of patients. Up to the result of this study it has been recommended for optimizing the treatment of this group of patients, other viral respiratory infections must be evaluated.
Conclusions In our study S. aureus strains obtained from children purulent-infectious diseases have high sensitivity to aminopenicillin with clavulan acid, meropenem, some cephalosporins, gentamycin. Among clinical strains of S. aureus we found methicillin- and even vancomycin-resistant microorganisms.

A RARE CASE OF LEMIERRE SYNDROME IN A 13 YEAR OLD CHILD

doi:10.1136/archdischild-2012-302724.0881

1 Velissariou, P Papapavlou, H Bairaktaris, I Fieris, I Kolovos, M Kaltzanti. 1Pediatrics; 2Vascular Surgery; 3Radiology, Metropolitan Hospital, Athens, Greece

Object To present a rare case of Lemierre syndrome in a 13 year old girl.

Case Report The child presented with pyrexia, pharyngitis and dysphagia of 9 days duration. On the fifth day of pyrexia she developed a painful mass on the left side of her neck with bilateral tonsillar enlargement with exudate.

The patient underwent cervical ultrasound and magnetic resonance angiography of the brain that revealed septic thrombophlebitis of the left internal jugular vein. Antibody testing for cytomegalovirus, toxoplasma gondii and Bartonella henselae were negative for active infection. Blood cultures did not have any growth. Computed tomography of the chest revealed multiple bilateral septic emboli, although the patient did not have any overt respiratory symptoms.

The patient received intravenous ceftriaxone and clindamycin for 3 weeks, followed by amoxicillin-clavulanic acid orally for another 3 weeks along with anticoagulation therapy for 8 months in total.

Three months later, she was clinically asymptomatic, computed tomography of the chest was clear and the thrombophlebitis of the left internal jugular vein was stable.

Almost two years later, the patient remains in a very good clinical condition without any similar recurrences.

Conclusions Lemierre syndrome is a rare combination of tonsillitis and septic thrombophlebitis of the internal jugular vein caused primarily by Fusobacterium necrophorum, an obligate anaerobic gram-negative rod. In our case, we did not isolate the causative agent, however the patient had an excellent outcome with antibiotic and anticoagulation therapy without any surgical intervention.

HEPATOMESPLINE CAT-SCRATCH DISEASE IN A 12-YEARS-OLD GIRL

doi:10.1136/archdischild-2012-302724.0882

0 Diaz-Morales, JD Martinez-Pajares, JC Ramos-Diaz, J Trigo-Moreno, E Fernandez-Gomez, M Miranda-Valdivieso. USC Pediatria, Hospital Comarcal de Antequera, Antequera, Spain

Background Cat-scratch disease (CSD) is an infectious disease typically characterized by a self-limited regional lymphadenopathy. However, CSD can include hepatic and splenic involvement. There are few data in the literature regarding treatment of this situation, even though the patient had an excellent outcome with antibiotic therapy suggested in the literature, and evolution appeared to be self-limited.

INCIDENCE OF LEISHMANIASIS IN A DISTRICT GENERAL HOSPITAL

doi:10.1136/archdischild-2012-302724.0883

1S Darnodaran, G Erumbala, D Abraham, S Nirmal. Paediatrics, James Paget Hospital, Great Yarmouth; 2PICU, Addenbrookes Hospital, Cambridge; 3Paediatrics, Milton Keynes General Hospital NHS Foundation Trust, Milton Keynes; 4NICU, Birmingham Children’s Hospital, Birmingham, UK

Aim To study the incidence of Leishmaniasis in children under 5 years in a District General Hospital in the UK.

Method The microbiology records over 5-years (2005–2010) were reviewed. Inclusion criteria were age under 5 years and diagnosis of Leishmaniasis on bone marrow examination.

Results Two cases were identified.

Case-1: A 15 month-old girl, family from east Timur, referred from primary care with weight-loss and a non-healing skin ulcer. She appeared undernourished with pallor, pyrexia and hepatosplenomegaly. FBC showed pancytopenia. Bone marrow examination confirmed Leishmaniasis. Her mother had intrapartum Leishmaniasis.

Case-2: A 22 month-old-boy presented with high fever and weight loss for 5 weeks. Examination confirmed pyrexia, pallor and hepatosplenomegaly. FBC revealed pancytopenia. Direct antigen test for Leishmania was positive. Leishmania Donovani complex was detected on bone marrow examination. There was no history of maternal infection.

Both children were born in United Kingdom with no history of foreign travel. They both responded well to treatment with ambi-

Discussion Leishmania Donovani, the protozoan parasite, is transmitted in endemic areas by the insect vector Phlebotomine sandfly. In non-endemic areas, transmission is vertical. The infection can lead to impairment in cell mediated immunity and a 100% mortality rate, if left untreated. Most cases of visceral Leishmaniasis occur in India, Bangladesh, Nepal, Brazil, and the Sudan. East Timor, although not endemic, has witnessed an upsurge of several confirmed cases recently. There was a history of maternal infection in only one of these two children. The source of infection in the other remains unidentified.

THE VARIABILITY IN THE COURSE OF HEPATITIS B IN CHILDREN AFTER MOTHER-TO-CHILD TRANSMISSION AS A REASON TO ADJUST TREATMENT

doi:10.1136/archdischild-2012-302724.0884

1B Kowalik-Mikołajewska, 1M Aniszewska, 1M Marczyńska. Department of Children's Infectious Diseases, Medical University of Warsaw; 2Hospital of Infectious Diseases, Warsaw, Poland

Background and Aims In Poland currently, despite obligatory hepatitis B vaccination we expect the occurrence of mother-to-child
