Discussion Training in the communication skill of breaking bad news is useful and interesting to medical students. Identifying key strategies to employ whilst breaking bad news, and engaging in role play, improves confidence.

Results Data were analyzed from a convenience sample of 25 responses (1/3 of all trainees). The M:F ratio was 3:1. Twenty three graduates (92%) completed overseas fellowships. Mean Likert scores were clinical competency (4.8), basic science knowledge (4.9), evidence based medicine application (3.7), ability to work as academic supervisor (3.3), research skills (2.9), health economics (2.3) and health policy (2.3). Negative themes from qualitative analysis included the adverse impact of excessive service provision on training and the lack of structured career advancement. Most felt clinically competent compared to international colleagues.

Conclusion Clinical competency is achieved through the HST program. Specific training is required for health management, policy and research aspects of training.

Background and Aims The movement of transformation through which passes the medical education in Brazil prompted us to understand and describe some aspects the Pediatric Education in medical undergraduate.

Methods For this we developed an exploratory research, descriptive, cross-sectional quantitative and qualitative approach. We investigated 16 courses and coordinators through semi-structured interviews and institutional documents. It became apparent concern for the context of teaching for all those who participated as study subjects.

Results The total workload of the course in undergraduate Pediatric Medicine held 10.07% of the total workload of the courses and their integration has occurred from the third year of graduation, with the primary health care settings primarily used in 93.75% of schools. The teaching plans demonstrate the enhancement of cognitive development in the learning process, with the psychomotor domain and affective ill-favored. The evaluation process found is focused on learning for students leaving a major void in the assessment of own teaching and their teachers. The practical evaluation of the teaching-learning of students is privileged only 15% of the courses and the assignment of concept is referred to in 87.5% of courses. We noted the will expressed by various schools and their parents, transformations aimed at improving education.

Conclusion The understanding of the teaching of Pediatrics as a fundamental part of general medical education at undergraduate level may, in our view, contribute to the formulation of projects that encourage the construction of new avenues for improving the teaching-learning process in Pediatrics.
