Conclusion These reference data on right ventricular and atrial dimensions and volumes can be used for follow-up studies of boys and girls at 6-years-of-age. 3D volumes correlated moderately with BMI.

1140 EFFECT OF A PILOT INTERVENTION ON SETTING UP LONG-TERM MECHANISM OF NEONATAL RESUSCITATION TRAINING IN 4 COUNTIES IN CHINA

doi:10.1136/archdischild-2012-302724.1140

Background and Aims Neonatal mortality is the leading cause of under-5 child deaths in China. The aim was to evaluate the effect of a pilot intervention on setting up long-term mechanism of neonatal resuscitation training in 4 counties in China.

Methods A neonatal resuscitation leading group was set up within each county level hospital to lead the in-hospital training, department coordination, resuscitation practices and cases audit. A random control survey was conducted in the intervention counties and 4 randomly selected control counties to evaluate the impact of the intervention. Indicators evaluated include knowledge and self-confidence score of health providers, in-hospital regulations, changes of asphyxia incidence and mortality.

Results Over 90% of intervention hospitals had carried out neonatal resuscitation related regulations requiring that trained paediatricians participate in case discussion of high-risk delivery and onsite resuscitation, while in control hospitals less than 55% had such requirements. The average knowledge score of health providers was significantly higher in the intervention counties than the control counties (9.19±1.18 VS 8.40±1.5). The average self-confidence score in the two groups were 57.33±2.50 and 54.09±8.19 respectively. The incidence of birth asphyxia (defined as Apgar scores<7) decreased from 8.83% to 5.99% in the intervention counties, and the intrapartum-related deaths in the delivery room decreased from 27.60 to 5.03 per 100,000. No significantly changes were found in the control counties.

Conclusions Setting up long-term mechanism of neonatal resuscitation training is an effective method to strengthen in-hospital training, build up capability for neonatal resuscitation and therefore, can decrease the incidence of neonatal asphyxia.

1141 THE DIAMETER OF CORONARY ARTERIES IN HEALTHY NEWBORN AT BIRTH, ONE AND SIX MONTHS OF AGES

doi:10.1136/archdischild-2012-302724.1141

Objective The aim of this study was to determine accurate and validated z-score equations for the normal values of coronary diameters adjusted with growth changes of the neonates by testing three different time periods.

Methods Echocardiography was performed on 200 healthy neonates at birth, one and six months of ages. Several regression models for the left (LCA) and right coronary artery (RCA) diameters were tested with weight, height, body surface area and aortic annulus diameter. Reliable standards for the coronary artery diameters for healthy newborns by determining z-score equations with appropriate statistical validations were established.

Results The coronary diameters on birth measurements were strongly correlated with birth weight, height, surface area and the diameter of the aortic annulus (Pearson’s R >0.8, all p<0.01). There were significant associations between the mean data of weight, height, body surface area, aortic annulus and the LCA and RCA diameters measurements of study subjects at birth, one and six months of ages (p<0.05).

Conclusion We present a new set of equations for neonatal z-score calculation on the basis of a large number of healthy neonates on three different time period consisting of birth, one and six month of ages. It is clear with this study that the growth in caliber of the coronary arteries is definite and progressive during postnatal time.
