prophylaxis was extended to neonates of birth weight of 1500 grams and below. The rate of invasive fungaemia was monitored as part of an ongoing CQI project to reduce nosocomial infection rates in the NICU.

**Results** 799 VLBWI were admitted during the study period out of which 227 were ELBWNI. There were no differences in birth weight, gestation and gender distribution.

**Conclusions** The introduction of a prophylactic oral nystatin administration policy was associated with a significant reduction in invasive fungal infection among high risk neonatal population.

### 1165 Rectal Swabs: An Increasingly Important Component of NICU Infection Surveillance Programmes?

**Background and Aims** Gram-negative bacteria present an increasing threat to NICU babies. Because the gastrointestinal tract is the primary colonisation site, we added rectal swabbing to routine admission and weekly screening of babies from September 2010. We consider here the impact of this strategy on clinical and infection control management.

**Methods** Rectal swabs were cultured for the following Gram-negative bacteria of interest (GNBi): Serratia; gentamicin-resistant &/or ESBL-producing Enterobacteriaceae; Pseudomonas aeruginosa (PA). Colonised babies were isolated, but were not treated with antibiotics unless clinically indicated.

**Results** GNBi (except PA) were isolated from 55 (2.6%) of 2101 admissions, September 2010–March 2012. 21 gentamicin-resistant Enterobacteriaceae; 9 ESBL-producing Enterobacteriaceae; 25 Serratia. 45 of the GNBi were detected in rectal swabs: in 38 (64.7%) rectal swabs were the first, and in 28 (53.3%) the only; culture-positive samples. Only one baby had GNBi infection (bacteraemia on the same day as a positive rectal swab).

There were 13 instances of 2–3 babies having the same bacterium within 7 days of each other. In one case, seven babies were found with Serratia over 7 days. PA results are not shown for the first 7 months, because of an exceptional event causing PA colonisation then. After April 2011 there were 5 cases (4 detected on rectal swabs: the only positive site in 3): there was no clustering of these cases.

**Conclusion** An unexpectedly high proportion of NICU babies had GNBi. The high frequency of patient-to-patient transmission suggests that rectal screening can be an important tool in controlling these bacteria.

### 1166 Performance of the Definitions of the Systemic Inflammatory Response Syndrome and Sepsis in Newborns

**Background and Aims** In 2002 the International Pediatric Sepsis Consensus Conference created definitions for the systemic inflammatory response syndrome (SIRS) and sepsis adaptable for paediatric patients. We aimed to examine the applicability of the pediatric definitions of SIRS and sepsis to newborns in the diagnosis of early (EOS) and late onset sepsis (LOS).

**Methods** Retrospective cohort study including

1. all term newborns hospitalized within the first 24 hours of life and
2. all infants with episodes of suspected LOS with a corrected gestational age of ≥37 weeks at onset of LOS from 2004 to 2008.

**Results** Thirteen of 245 newborns included had culture proven EOS (5%) and 5 newborns had culture proven LOS. SIRS and sepsis criteria applied to 38% of EOS positive infants and to 100% of LOS positive infants. The two major diagnostic criteria white blood cell count and fever/hypothermia, of which at least one has to apply for fulfilling SIRS and sepsis criteria, had a sensitivity of 15% and 38% in diagnosis of EOS and of 100% and 80% in diagnosis of LOS, respectively.

**Conclusions** The definitions of SIRS and sepsis applied to all cases of culture proven LOS. However, the single diagnostic criteria were insensitive in diagnosis of culture proven EOS with thus wrong classification of more than 60% of all cases. An evidence based approach to find the appropriate criteria for defining EOS in newborns is needed.

### 1167 Does Maternal Intrapartum Antibiotics Prolong the Incubation Time Required for Blood Cultures to Become Positive for Infants with Early-Onset Sepsis?

**Background and Aims** Gram-negative bacteria present an increasing threat to NICU babies. Because the gastrointestinal tract is the primary colonisation site, we added rectal swabbing to routine admission and weekly screening of babies from September 2010. We consider here the impact of this strategy on clinical and infection control management.

**Methods** Rectal swabs were cultured for the following Gram-negative bacteria of interest (GNBi): Serratia; gentamicin-resistant &/or ESBL-producing Enterobacteriaceae; Pseudomonas aeruginosa (PA). Colonised babies were isolated, but were not treated with antibiotics unless clinically indicated.

**Results** GNBi (except PA) were isolated from 55 (2.6%) of 2101 admissions, September 2010–March 2012. 21 gentamicin-resistant Enterobacteriaceae; 9 ESBL-producing Enterobacteriaceae; 25 Serratia. 45 of the GNBi were detected in rectal swabs: in 38 (64.7%) rectal swabs were the first, and in 28 (53.3%) the only; culture-positive samples. Only one baby had GNBi infection (bacteraemia on the same day as a positive rectal swab).

There were 13 instances of 2–3 babies having the same bacterium within 7 days of each other. In one case, seven babies were found with Serratia over 7 days. PA results are not shown for the first 7 months, because of an exceptional event causing PA colonisation then. After April 2011 there were 5 cases (4 detected on rectal swabs: the only positive site in 3): there was no clustering of these cases.

**Conclusion** An unexpectedly high proportion of NICU babies had GNBi. The high frequency of patient-to-patient transmission suggests that rectal screening can be an important tool in controlling these bacteria.

### 1168 Microbial Profile by Bactec in a Level Three Neonatal Intensive Care Unit in Rural Western India

**Background and Aims** In 2002 the International Pediatric Sepsis Consensus Conference created definitions for the systemic inflammatory response syndrome (SIRS) and sepsis adaptable for paediatric patients. We aimed to examine the applicability of the pediatric definitions of SIRS and sepsis to newborns in the diagnosis of early (EOS) and late onset sepsis (LOS).

**Methods** Retrospective cohort study including

1. all term newborns hospitalized within the first 24 hours of life and
2. all infants with episodes of suspected LOS with a corrected gestational age of ≥37 weeks at onset of LOS from 2004 to 2008.

**Results** Thirteen of 245 newborns included had culture proven EOS (5%) and 5 newborns had culture proven LOS. SIRS and sepsis criteria applied to 38% of EOS positive infants and to 100% of LOS positive infants. The two major diagnostic criteria white blood cell count and fever/hypothermia, of which at least one has to apply for fulfilling SIRS and sepsis criteria, had a sensitivity of 15% and 38% in diagnosis of EOS and of 100% and 80% in diagnosis of LOS, respectively.

**Conclusions** The definitions of SIRS and sepsis applied to all cases of culture proven LOS. However, the single diagnostic criteria were insensitive in diagnosis of culture proven EOS with thus wrong classification of more than 60% of all cases. An evidence based approach to find the appropriate criteria for defining EOS in newborns is needed.
