**Background and aims** Preterm brain injury of premature born infants is a main cause of disability and represents an enormous individual, familial and social burden. Up to 50% of these children suffer from disabilities such as cerebral palsy and cognitive disorders. The aetiology of brain injury has been considered to be multifactorial. Factors such as hyperoxia or inflammation are important pathomechanisms in the development of brain injury.

As infections and subsequent inflammation are almost unavoidable in NICUs, new anti-inflammatory approaches are needed. In different experimental settings, mesenchymal stem cells (MSCs) show these anti-inflammatory abilities. Although intravenously administered MSCs get trapped in the lung, therapeutic effects in target tissue are detectable, thereby indicating paracrine mechanisms. Since MSC-supernatants contain molecules with immunosuppressive functions, such as the identified TSG-6, we wondered whether MSC supernatants contain additional, maybe synergistically acting factors. The objective of this study is to evaluate the effect of concentrated MSC-supernatant on brain damage caused by inflammation.

**Methods** Wistar rats were randomized in 4 groups (vehicle/vehicle, vehicle/concentrated MSC-supernatant, LPS/vehicle, LPS/concentrated supernatant). LPS (0.25mg/kg) was administered at p3, concentrated MSC-supernatant at p3 and p4. At p5, animals were transcardially perfused, brains were removed and snap-frozen for molecular biological analysis.

**Results** At p5, LPS-treated animals show a marked increase in apoptosis, whereas additional treatment with concentrated MSC-supernatant results in a decrease in neural apoptosis.

**Conclusions** Concentrated MSC-supernatant showed promising effects on inflammation-induced brain damage in an experimental model of encephalopathy of prematurity.

**Abstract 168 Figure 1**

**Conclusions** This first data in human preterm infants with and without ROP treatment show trends with increasing postmenstrual age, and that VegF levels in infants treated with bevacizumab do not appear to differ from those untreated or those treated with laser. Individual infants receiving bevacizumab had lower VegF levels in the first week after injection than before. As bevacizumab treatment increases efforts should be made to further assess effects on circulating VegF.

**HOSPITAL MORTALITY IN 2,437 INFANTS IN THE AUSTRALIAN, NEW ZEALAND AND UK BOOST II TRIALS OF NEONATAL OXYGEN SATURATION TARGETING**

WD Tamow-Mordi, 1B Stenson, 1B Darlow, 1P Brocklehurst, 1C Morley, 1P Davis, 1E Juszczak, 1A King, 1K Simmer, 1A Kirby, 1M Donoghue, 1A Ghadge, 1W Hague, For the Australian, New Zealand and UK BOOST II Collaborative Study Groups. 1WINNER Centre, NHMRC Clinical Trials Centre, University of Sydney; 2NHMRC Clinical Trials Centre, University of Sydney, Sydney, NSW, Australia; 3Simpson Centre for Reproductive Health, Royal Infirmary, Edinburgh, UK; 4Christchurch Women’s Hospital, University of Otago, Christchurch, New Zealand; 5National Perinatal Epidemiology Unit (NPEU), University of Oxford, Oxford, UK; 6Royal Women’s Hospital, University of Melbourne, Melbourne, VIC; 7King Edward Memorial Hospital, University of Western Australia, Perth, WA, Australia

**Background** The optimal oxygen saturation (SpO₂) for preterm infants is unknown. Three BOOST II trials in Australia, New Zealand and UK are comparing outcomes in infants < 28 weeks after randomisation to SpO₂ targeting of 85–89% vs 91–95%, using masked oximeters.1 In interim analysis the high target increased 36 week survival in infants whose oximeter had been upgraded with new, more accurate software.2,3

**Methods** Pooled analysis of hospital mortality by target, overall and by old or new software.
