**Conclusion** In the group of massaged infants, it seems to obtain better results in motor milestones and in cognitive development, faster maturation of stereopsis, a decrease in visual acuity have been also reached.

**Background and Aims**

During the last 5 years, we noticed an increasing incidence of scarlet fever and streptococcal pharyngitis in our country. The aims of this study were:

1. To appreciate the positive results rate for beta-hemolytic pyogenic streptococci in throat specimens (group A – streptococci gAs, group C – gCs, group G – gGs);
2. To evaluate ratio of each streptococcal group pharyngeal infection;
3. To establish correlation between streptococcal infections and diseases that justified throat cultures.

**Methods**

The authors designed a retrospective epidemiological study, analyzing microbiology department data during 14 months period. Inclusion criteria: hospitalized and ambulatory care children aged between 2–18 years (scarlet fever diagnosis, pharyngitis diagnosis, healthy children requesting throat exam). Exclusion criteria: children up to 2 years of age. In order to identify streptococci, authors used Columbia agar with 5% sheep blood, Bacitracin inhibition disc test; the Kaplan-Meier method was used to analyse data regarding symptom duration.

**Results**

Among 6653 throat cultures, 497 isolates (7.47%) were positive. Ratio for each streptococcal group was: group A – 88.0%, group C – 6.2%, group G – 5.8%. Seasonal incidence: higher incidence was reported in February and lower incidence in August. Regarding correlation between patient diagnosis and identified streptococci group in throat specimens (p value =0.000): 112 scarlet fever patients (111 gAs, 1 gGs), 264 pharyngitis patients (234 gAs, 18 gCs, 17 gGs), 121 healthy children (93 gAs, 18 gCs, 10 gGs). Last mentioned patients mean pyogenic streptococci carriers (24.34%).

**Conclusions**

Carriers represent the “infection pool” for community children, maintaining persistence of source infection and explaining diminished efficacy of epidemiological measures and infection outbreaks in pediatric population.

**Abstract 1738 Figure 1**

URI symptom duration between placebo and FKGM.

**Conclusions**

FKGM was more effective than the placebo in terms of reducing the duration of URI symptoms and reducing nasal discharge. These findings suggest that FKGM can be used for the replacement of antibiotics.

**Abstract 1737 EPIDEMIOLOGICAL ASPECTS OF STREPTOCOCCAL PHARYNGEAL INFECTIONS IN PEDIATRIC POPULATION**

**Background**

During last 5 years, we noticed an increasing incidence of scarlet fever and streptococcal pharyngitis in our county.

**Aims**

1. To appreciate the positive results rate for beta-hemolytic pyogenic streptococci in throat specimens (group A streptococci gAs, group C gCs, group G gGs);
2. To evaluate ratio of each streptococcal group pharyngeal infection;
3. To establish correlation between streptococcal infections and diseases that justified throat cultures.

**Methods**

Authors designed a retrospective epidemiological study, analyzing microbiology department data during 14 months period. Inclusion criteria: hospitalized and ambulatory care children aged between 2–18 years (scarlet fever diagnosis, pharyngitis diagnosis, healthy children requesting throat exam). Exclusion criteria: children up to 2 years of age. In order to identify streptococci, authors used Columbia agar with 5% sheep blood, Bacitracin inhibition disc test; the Kaplan-Meier method was used to analyse data regarding symptom duration.

**Results**

Among 6653 throat cultures, 497 isolates (7.47%) were positive. Ratio for each streptococcal group was: group A – 88.0%, group C – 6.2%, group G – 5.8%. URI symptom duration between placebo and FKGM.

**Conclusions**

FKGM was more effective than the placebo in terms of reducing the duration of URI symptoms and reducing nasal discharge. These findings suggest that FKGM can be used for the replacement of antibiotics.

**Abstract 1739 SOCIOECONOMIC CHARACTERISTICS OF THE CHILDREN WHO NEEDED HOSPITALIZATION IN A PEDIATRIC INTENSIVE CARE UNIT (PICU)-RETROSPECTIVE ANALYSIS**

**Background and Aims**

Korea has known high antibiotics prescription in children upper respiratory tract infections (URIs). Recently, herbal therapy is be magnified instead of unnecessary antibiotics prescription. *Forsythia Koreana* has been extensively used for the treatment of viral and bacterial respiratory tract infections. However, it remains unclear whether the herbal medicine has beneficial effects through clinical control study in URIs. Therefore, to investigate the anti-viral effects of *Forsythia Koreana* included herbal medicine (FKGM) on URIs in children, we conducted a randomized, double-blind, placebo-controlled study.

**Methods**

Participants included 29 children who received either placebo (n=15) or FKGM (n=14) at the onset of URIs symptoms. The therapeutic effects assessed URI symptoms scoring system given by the James A Taylor for clinical studies to identify children with a documented viral URIs. Results were evaluated using student’s t-test; the Kaplan-Meier method was used to analyse data regarding symptom duration.

**Results**

FKGM was more effective than the placebo in terms of reducing the duration of URI symptoms and reducing nasal discharge. These findings suggest that FKGM can be used for the replacement of antibiotics.
Background and Aims PICU provides high level of care to critically ill or injured children. Our aim was to analyse the socioeconomic characteristics of their families.

Methods 127 children, hospitalized from 10/05/2008 to 10/5/2009, were analyzed retrospectively: age, gender, parents’ age, nationality, residence, marital status, number of childrens, parents’ education, employment, insurance, and way of transportation, and were correlated with the days of hospitalization, severity scores and outcome. Data analysis with the SPSS 17.

Results 73 (57.5%) were males and 54 (42.5%) girls, mean age 4.5 and 6.7 years respectively. 78.2% were from this country, and 4.1% tourists, 17.5% immigrants and 2.3% gypsy. No significant difference in the distribution for gender, but a statistically significant difference in educational level of both parents, in relation to nationality (p<0.011). 75% foreign and 10% Greeks parents were primary schools, 15% and 70% high school and only 7% and 20% university graduates, respectively. Higher TISS 28 and TISS 76 (worst condition) in foreigners. Higher PRISM and PRISM Predicted Mortality (%) severity scores (more serious condition), higher TISS 28 and TISS 76 and more days of hospitalization in children transported by ambulance/airplane. For- eigner children, transferred by ambulance or airplane, had the higher death rate.

Conclusions The severity of illness, duration of hospitalization and outcome, appear to be related to the socioeconomic characteristics of families and the way of transportation.

Epidemiology of Severe Traumatic Brain Injury (TBI) in Pediatric Population of the West of Algeria

H Bouguetof, MA Negadi, K El Halimi, D Bournendi, ZC Mentouri. Pediatric Intensive Care Unit, Faculty of Medicine - Oran University, Oran, Algeria

Background and Aims Algeria is in the fourth rank of road accidents in the world.

The Aim of the study was to provide recommendations to government and health authorities, based on hard evidence, for improving health care delivery to children with severe TBI in the referral region of the university hospital center in Oran.

Method In this cohort, all children with severe TBI was admitted to the Paediatric Intensive Care Unit (PICU) of the University Hospital Centre of Oran, between the January 1, 1995 and December 31, 2007.

Results The average age is 7 years 1/2. Road accidents are in the origin of more than 70% of the cases in which 80% are pedestrians. 65% of pedestrians are injured on roads in rural environment (countryside). The pre hospital management is unfortunately almost absent. 1/3 of children had GCS score < 5. Median Injury Severity Scale (ISS) score was 26 (IQR 21–33; Range 9–75). The polytrauma-tism represents 1/5 of the cases. The cerebral œdema was found in 3/4 of the cases. On the 573 children, the rate of survival is 61 %. In this study, the road accidents represent the main cause of severe TBI in children and are responsible of a more high mortality essentially due to the absence of prehospital management.

Conclusion The improvement of prehospital management must be reduce the mortality and improve the prognosis of severe TBI and the information of the population should be promoted to reduce the frequency of severe TBI.

Pulse Oximetry in Healthy Newborns After Midwifery Supervised Uncomplicated Home Births: Use of International Accepted Percentiles

H Bouguetof, MA Negadi, K El Halimi, D Bournendi, ZC Mentouri. Pediatric Intensive Care Unit, Faculty of Medicine - Oran University, Oran, Algeria

Aim To evaluate if international accepted percentiles of neonatal oxygen saturation and heart rate values are applicable in infants born after non-intervention vaginal deliveries.

Methods During ten consecutive months, 27 midwives in the Leiden region used a Masimo pulse oximeter and perform measurements directly after birth infants born after non-intervention vaginal deliveries. Data was stored and analyzed using the skewness-median-coefficient of variation (LMS) method.

Results During the study period oximetry was recorded in 101 births. Percentiles of oxygen saturation and heart rate are shown in figure 1 and 2. The percentiles are comparable to the international accepted values, except for the first 3 minutes for oxygen saturation and the first minute for heart rate.

Abstract 1741 Figure 1

Abstract 1741 Figure 2

Conclusions The accepted percentiles for heart rate and oxygen saturation are applicable to infants born after a non-intervention
