1845 DO MOTHERS AND FATHER TO PRETERM EVALUATE THEIR EXPERIENCE OF STRESS AND NURSE’S SUPPORT DIFFERENTLY WHEN HOSPITALIZED IN A NICU?

trust, Drammen; 2Department of Pediatrics, Oslo University Hospital, Rikshospitalet; Midwifery; 3Nursing & Midwifery Faculty, Tabriz University of Medical Sciences, Tabriz, Iran

Background Studies show that mothers and fathers of a premature infant have high levels of stress. Studies also confirm the importance of nursing support to reduce stress of parents.

Aim To explore gender differences in experiencing parental stress and nursing support of mothers and fathers who become parents to premature infants and receive standard care.

Methods Mothers and fathers (N=82) answered two self reporting questionnaires, the Nurse Parent Support Tool (NPST) once and the Parental Stressor Scale (FSS: NICU) twice. The NPST consists of 21 items classified into four dimensions, information, appraisal, emotional support and nursing care. The FSS: NICU is designed to measure parental perception of stressors arising from the physical and psychosocial environment of the NICU.

Result At baseline both mothers and fathers experienced high stress levels in relation to the infants appearance, some to the parental role and alteration and less on the dimension of sight and sound. The fathers’ experienced higher levels of stress at follow up compared to baseline for a number of variables. There were no significant differences regarding parents’ experiences with support from nurses.

Conclusion Mothers’ experiences of stress decrease but fathers report increased stress at discharge to home compared to their responses at baseline. In spite of this both parents were satisfied with the support from nurses, especially in relation to the information dimension and the nursing care dimension. As a result of this study we have become aware of the importance of stress preventing initiatives towards fathers of “healthy” premature infants.

1846 ASSESSMENT OF SOUND LEVELS IN A NEONATAL INTENSIVE CARE UNIT IN ALZAHRA TEACHING HOSPITAL IN TABRIZ, IRAN

MB Hosseini, SValizadeh, NS Alavi. “Neonatology, Pediatrics; 3School of Nursing and Midwifery, Tabriz University of Medical Sciences, Tabriz, Iran

Introduction The maleffects of loud noise on preterm infants have been recognized for years and the necessity of measuring the noise level and its reduction in NICU has been proven to the Neonatalogists.

Aim This study aims to evaluate the noise level of NICU in Tabriz Alzahra hospital and compare it with the standard level and also to specify the noise producing sources.

Materials and Methods 24 accidental, continuous hours were selected in four working days and the Leq, L10, Lmax and Lpeak values were measured in six fixed spots of NICU ward using a sound level meter based on dBA.

Results The mean of noise levels gained in the form of Leq (M=63.46 dB), L10(M=65.81dB), Lmax(M=71–24dB) in six different spots and hours of measurement was higher than the standard level (NICU Leq=45dB, L10=50dB, Lmax=65dB). There was no significant difference in the noise level of the six spots measured. The loudest Leq belonged to the round hours of the nurses and had a direct relationship with the number of people present in the ward. The least Leq was related to the time when the fewest number of people were present in the ward. Based on their intensity, the noise producing sources were application of metal equipments and dropping them, presence of students, nurse rounds, physicians’ rounds, alarms of devices and the wheels of portable trolleys, respectively.

Conclusion Noise level in NICU ward is higher than the standard level, it is necessary to take measures for the purpose of reducing it.

1847 CLINICANS DOCUMENTATION OF OXYGENATION AND VENTILATION IN PREMATURE AND SICK NEWBORNS IN A NORWEGIAN NEONATAL INTENSIVE CARE UNIT (NICU)

MT Solberg, TWR Hansen, IT Bjark. Department of Nursing Science, University of Oslo; Institute of Clinical Medicine, Faculty of Medicine, University of Oslo, Oslo, Norway

Background and Aims Clinical practice concerning oxygen assessment and administration varies between nurses. Ventilator management, pulse oximetry alarm settings and monitoring also varies greatly. Clinicians would benefit from analysis of what they should do to effectively improve the outcomes and avoid hyperventilation and hyperoxia in newborns. The aim of this study was to investigate how nurses documented oxygenation and ventilation in premature and sick newborns on respirator treatment.

Method This was a retrospective study (2010–2011) of the documented oxygen treatment from one NICU in Norway. Based on research literature and clinical practice, variables for oxygen treatment in preterm and sick newborns on respirator were defined. A power analysis resulted in the inclusion of 138 newborns. The diagnoses were defined in four categories classified by ICD –10 (KITH-Health Affairs); immature lungs, lung problems, circulation problems and infection. We estimated the proportion of newborns where oxygen saturation was documented outside the recommended limit of 88–95%.

Results At this time we have the results from 110 cases, constituting documentation from 3904 hours of respirator time. We compared the oxygen saturation, PaCO2, and PaO2 values in relation to disease conditions and oxygen administration in the premature and sick newborns. We will report statistics on these variables.

Conclusions These results will be incorporated in an action research study. Clinicians in the NICU will reflect and evaluate on the results in order to develop best practice in oxygenation and ventilation.

1848 GENTLE HUMAN TOUCH AND YAKSON: THE EFFECT ON PRETERM’S BEHAVIORAL REACTIONS

F Eshghi. Kerman University of Medical Sciences, Raz University of Nursing and Midwifery, Kerman, Iran

Objective Touch is one of the first strong positive senses that develop in neonate. Therapeutic touch could be considered as a complementary treatment in Neonate intensive care units (NICU).

Design This quasi experimental study was conducted to compare the effect of Yakson and GHT on behavioral reaction of preterm infants hospitalized in NICU in South-East of Iran.

Patients 90 preterm infants participated in this study. They randomly divided into 5 groups: 1) Yakson group, n=30, 2) GHT group, n=30, 3) control group, n=30.

Methods Each infant received the GHT and Yakson interventions twice a day for 5 days. Each session lasted 15 minutes. The control group received routine nursing care.

Results In interventional group, an increase was found in sleep state score after the Yakson and GHT intervention. Their awake and fussy states’ scores decreased after both interventions. No significant difference was found between Yakson and GHT group in their behavioral state scores.

Conclusions The findings suggest that Yakson and GHT had soothing and calming effect on preterm infants and could be beneficial in nursing interventions.
Introduction  Some studies have indicated that home-based newborn visit interventions can prevent of newborn deaths The aim of this study was to determine the effectiveness of home visit on mortality and morbidity of Preterm newborn.

Method  This is a semi-experimental study in which Preterm newborn with fetal age of less than 37 weeks weighing below 2500 grams were placed in two groups of case (30 neonates) and control (30 neonates) randomly. Home visit was presented to case group for a period of 6 months after discharging from hospital. Control group received hospital routine cares and referred for visiting. Both groups were followed up for a period of 6 months. The samples of both groups were compared with each other from the view point of mortality and hospitalization. Collected data were analyzed using X² and independent T test.

Results  The mortality during first six months of life of both groups did not show any difference (P>0.05). However, the number of inpatient cases of neonates and also the number of their disease cases not required to be hospitalized during first six months of life among case group was less than that of control group (P<0.05).

Conclusion  The results of this study indicated that, carrying out home visit by health care givers results in reducing the number of inpatient cases of neonates during first six months of life. Therefore, it is suggested to appoint home visit as a part of health programs so as to reduce neonates' hospitalization cases and thereby to improve their health.

THE MEANING OF PERSONAL DIARIES IN PICU TO CHILDREN AND FAMILIES

Background and Aims  In our PICU, nurses have for several years been writing a personal diary for all children admitted for 3 days or more. The purpose of the diary is to help the children understand their recollections and experiences from the PICU stay and thereby support their coping.

Research involving adult ICU patients has explored patients experiences with diaries and the effect on psychological outcome, but no PICU studies have been reported on the subject.

Thus the aim of our study was to investigate how diaries are being used and to explore their role in coming to term with the PICU stay.

Methods  5 semi-structured interviews with children and their families, 4–6 months after discharge from PICU. The data was analyzed using the method of systematic textcondensation described by Kosti Malterud. During this analytic process the text is decontextualised into "units of meaning" from which themes and subthemes are identified.

Results  One family had not used the diary much and ascribed this to a short PICU stay. The remaining families all expressed positive opinions of the diary and saw it as one of several tools to help understand and make sense of their experiences from PICU.

Three main themes emerged from the analysis:

Value to the entire family.
Creating memories.

The importance of pictures.

Conclusions  Personal diaries are used in the families after discharge as support for both children and their relatives. They play an important role in making the PICU experience meaningful by providing explanations and coherence.

EFFECT OF HOME VISIT ON MORTALITY AND MORBIDITY OF PRETERM NEWBORN

EFFECT OF CONFLICT RESOLUTION TRAINING ON BEHAVIORAL PROBLEMS IN CHILDREN IN COUPLES REFERRING TO COUNSELING CENTERS IN SHIRAZ-IRAN, 2011

doi:10.1136/archdischild-2012-302724.1852

1F Sharif, 2S Solymani, 3A Mansi, 4S Keshavarzi. 1Psychiatric & Mental Health Nursing, Community Based Nursing & Midwifery Research Center; 2Psychiatric & Mental Health Nursing; 3Psychiatry, 4Biostatistic, Shiraz University of Medical Sciences, Shiraz, Iran

Background and Aim  Marital conflicts are among the most common problems in today’s society. The impacts of marital conflicts on the children’s behavioral problems have also been approved. We aimed to examine the effects of conflict resolution training on the children’s behavioral problems in a sample of Iranian couples.

Methods  This study performed on 56 couples who had the required criteria & were randomly selected. These couples had moderate to severe conflict scores (60 and over) based on the marital conflict questionnaire. The subjects were divided into two groups, using blocking random allocation. Then the experimental group was randomly subdivided into three groups and received 10 sessions conflict resolution skills training. The level of conflict and child behavioral problems was checked before, immediately, and one month after intervention in the experimental groups. In the control group these amounts were checked before and one month after intervention.

Results  In this study both groups were homogenous demographically with no statistically significant differences. Mean score of marital conflict before, immediately, and one month after intervention was statistically significant in men and women (P<0.0001); But not in control group. Mean score of child behavioral problems before, immediately, and one month after intervention was not statistically significant in both groups.

Conclusion  Conflict resolution training was effective in reducing marital conflicts. Therefore this method can be recommended for couples.
