trough level. There was a significant reduction in the number of babies with high trough amikacin levels after the dose was changed from 12 mg/kg/day to 12 mg/kg every 36 hours. We recommend this dose for use in infants less than 32 weeks gestation with continued monitoring of amikacin levels.

Aims To identify independent predictors of clinical and microbiological treatment failure and develop a predictive model in neonates with bloodstream infections (BSIs).

Methods A total of 1078 episodes of BSI occurred in 793 neonates in a tertiary-level neonatal intensive care unit (NICU) between 2004 and 2012 were enrolled. Patient demographics, underlying chronic comorbidities, clinical features, antimicrobial treatment and microbiological characteristics were evaluated.

Results Presence of underlying congenital anomalies (odds ratio [OR] 2.22, 95% confidence interval [CI] 1.15–4.29) and pulmonary hypertension (OR 3.57, 95% CI 1.65–7.70), infections caused by multidrug-resistant gram-negative bacteria (OR 2.84, 95% CI 1.21–6.66), Group B streptococcus (OR 3.08, 95% CI 1.31–7.26), and fungus (OR 4.06, 95% CI 1.97–8.38), a NTSS score of ≥ 23 (OR 6.61, 95% CI 2.40–26.47), inappropriate antibiotics (OR 2.01, 95% CI 1.31–3.08), and concomitant meningitis (OR 4.35, 95% CI 2.13–8.89) and ventilator-associated pneumonia (OR 2.82, 95% CI 1.26–6.32) were identified as independent risk factors for 28-day treatment failure in neonatal bacteremia. A risk-score model was created by adding points for each independent risk factor, and had a c-statistic of 0.83. Patients with risk scores of 0, 4, 8, 12 and 15 had estimated 28-day treatment failure rates of approximately 3%, 17%, 52%, 85% and 95%, respectively.

Conclusions This predictive model, calculated after documentation of a BSI, reflects spectrum of BSI severity and is associated with subsequent treatment failure through illness severity score and case-mix variables. This simple score could prove useful in clinical and research settings, and practical in estimating the prognosis.

Aim We aimed to evaluate nosocomial infection (NI) rate and antimicrobial susceptibilities of microorganisms causing NI in our Neonatal Intensive Care Unit (NICU).

Material and method NI afflicting infants admitted to NICU of Bahcesehir University Göztepe Medicalpark Hospital between January 2012 and December 2012 were assessed using Centre For Disease Control And Prevention (CDC) criteria. Only culture-positive infants were enrolled.

Results Of 328 infants, 49.1% were preterm. Thirty-five nosocomial infections occurred in 19 (6.4%) patients. Incidence density was 6.8/1000 patient-days. Attrac rate per patient was 1.84. Two infants (10.5%) succumbed to death, one with a liver abscess due to Staphylococcus epidermidis, other with Candida albicans sepsis. Ventilator associated-pneumonia (VAP) rate (n = 4) 2.3/1000, sepsis rate (n = 19) 5.7/1000, UTI rate (n = 10) 1.5/1000, wound infection rate (n = 1) 0.1/1000, catheter infection rate (n = 2) 4/1000 and meningitis rate were (n = 1) 0.1/1000. Of 35 nosocomial agents 22 (62.8%) were gram negative (10 Klebsiella spp, 4 Enterobacter, 3 Acinetobacter, 3 E. coli, 2 Pseudomonas), 10 (28.5%) were gram positive and 3 (8.6%) were Candida spp. All gram negatives were resistant to cephalosporins. Thirty-one percent of gram negative bacteria were resistant to carbenapenems. Carbenapenem-resistant gram negative agents were namely Acinetobacter baumannii complex, Pseudomonas aeruginosa and Enterobacter cloacae complex. All bacteria were susceptible to colistine.

Conclusion ESBL positive and carbenapenem-resistant gram negative bacteria are threats for NICU. It is of vital importance to implement reasonable antibiotic strategies and to propagate standard infection control measures.
Conclusions EOS in term infants is associated with significantly lower maternal and neonatal 25-OHD levels. We also found that levels of 25-OHD in neonates were positively correlated with those in mothers. These data suggest that adequate vitamin D supplementation during pregnancy may be helpful to prevent EOS in term neonates.

PS-223  STAPHYLOCOCCUS CAPITIS IN NEONATAL LATE-ONSET SEPSIS: UNEXPECTED WORLDWIDE DISSEMINATION OF AN ENDEMERIC MULTI-RESISTANT CLONE

M Butin, 2P Martins Simoes, 3H Lemniss, 3S Lemniss, 2R Vandenesch, 3O Claris, 3IC Picaut, 3PR Raoult. 1Clinical Microbiology, Hospices Civils de Lyon, Lyon, France; 2Université Lyon 1, Lyon, France; 3Inserm, Lyon, France; 4Laboratoire de Recherche Et d’Analyses Médicales, Fraternelle de La Gendarmerie Royale, Rabat, Morocco; 5NICU, Hospices Civils de Lyon, Lyon, France

Background Multi-resistant Staphylococcus capitis NRCS-A is involved in late-onset sepsis (LOS) in French NICUs. Aims To investigate the geographical distribution of NRCS-A, and to precise its susceptibility profile.

Methods Twelve S. capitis isolates from distant NICUs (Australia, Belgium, France, United Kingdom, n = 3 each) and 2 S. capitis isolates from adult patients were analysed using PFGE, SCCmec typing, dru-typing, a MLST-like analysis, and antimicrobial susceptibility testing. To explore impact of vancomycin selective pressure, after 15 daily subcultures with vancomycin, SCCmec typing, dru-typing, a MLST-like analysis, and antimicrobial susceptibility profile including aminoglycosides and methicillin resistance, and vancomycin heteroresistance. These antimicrobial susceptibility profile and were similar to NRCS-A profile, (ii) harboured a SCCmec type, (iii) formed a monophyletic group, (iv) harboured a same antimicrobial susceptibility profile including aminoglycosides and methicillin resistance, and vancomycin heteroresistance. These molecular and antimicrobial susceptibility profiles differed from those of adult isolates. An increase of vancomycin and daptomycin MICs was observed, significantly faster (p < 0.05) for NRCS-A isolates than other tested strains.

Conclusion Our analysis demonstrates an unexpected worldwide distribution of S. capitis NRCS-A, specifically in NICUs. Recently, we collected complementary NICU isolates belonging to NRCS-A from Norway, Denmark, the Netherlands, USA, Brazil, New Zealand and Canada, confirming the worrisome dissemination of NRCS-A. Its multi-resistant profile and its ability to rapidly adapt to vancomycin selective pressure, constitute a selective advantage to NRCS-A in NICUs, and raise the issue of potential therapeutic failure and the need for alternative antimicrobial regimens.

Neonatology Clinical

PS-224 VIDEO EDUCATION TO IMPROVE BAG MASK VENTILATION DURING SIMULATED NEWBORN RESUSCITATION

1P Deindl, 2J Schwindt, 3A Berge, 3G Schmoezer. 1Department of Neonatology and Pediatric Intensive Care Medicine, University Medical Center Hamburg-Eppendorf, Hamburg, Germany; 2Department of Pediatrics and Adolescent Medicine Division of Neonatology Pediatric Intensive Care and Neonopediatrics, Medical University of Vienna, Vienna, Austria; 3Department of Pediatrics and Adolescent Medicine Division of Neonatology Pediatric Intensive Care and Neonopediatrics, Royal Alexandra Hospital, Edmonton, Canada

Aim To evaluate if video based education could improve quality of positive pressure ventilation (PPV) performed by novice health care providers during neonatal resuscitation.

Methods Twenty-eight 4th year medical students were randomly paired and instructed to give PPV to a modified manikin as single-person resuscitators, then as two-person paired resuscitators using either an anatomical shaped neonatal face mask with an air cushion rim (IS) or a Laerdal round face mask (LM). After watching a video-tutorial they randomly repeated each mask ventilation performance. Airway pressure, gas flow, tidal volume, and mask leak were recorded. PPV performance quality was analysed using video recording.

Results Mask leak was lower during one-person ventilation when using IS (56 ± 16%) compared to LM (71 ± 19%). LM mask leak during one-person ventilation was significantly lower when using the two point top hold in contrast to the ok rim hold (before training: 63 ± 22% vs. 72 ± 18%, after training: 57 ± 17% vs. 77 ± 12%, respectively). Watching a video-tutorial improved correct head position (score: 1.4 ± 0.7 vs. 3.8 ± 0.5) for NRCS-A isolates than other tested strains.

Conclusion Simulation training is a valuable means of maintaining skills and enhancing confidence for neonatal resuscitation. This study quantifies the positive impact of a Quality Improvement Initiative aimed at improving performance at neonatal resuscitation.

Aims To introduce a Quality Improvement Initiative aimed at instilling confidence and competence with Neonatal Resuscitation in Labour Ward (LW) and Neonatal Unit (NICU) staff.

Methods A Neonatal Resuscitation Initiative Team (NRIT) consisted of LW and NICU midwives, an Advanced Nurse Practitioner (ANP) and a Paediatric Consultant. LW, NICU and paediatric staff were invited to attend a presentation to outline the aims and methodology of the initiative. Emphasis was placed on teamwork with effective leadership and communication. This was followed by a demonstration of 2 low fidelity simulated neonatal resuscitations performed by the NRIT.

Midwifery and NICU staff were then invited to partake in a Simulated Team Response (STR) to 2 simulated resuscitations. A random selection of participants completed a closed questionnaire before and after the NRIT demonstration and before and after their STR. Levels of confidence in all aspects of neonatal resuscitation, including teamwork and leadership skills were evaluated using a Likert Scale.

Results One hundred and thirteen staff participated in the quality initiative from January 2013 to August 2013. Seventy four staff participated in the NRIT demonstrations and 39 in the STR. Forty three questionnaires were completed following the NRIT and 13 following the STR. Using a Wilcoxon test the post gain in confidence score was statistically significant (p = 0.0020) for doctors and midwives.

Conclusion Improvement Initiative aimed at improving performance at neonatal resuscitation.
