Conclusions EOS in term infants is associated with significantly lower maternal and neonatal 25-OHD levels. We also found that levels of 25-OHD in neonates were positively correlated with those in mothers. These data suggest that adequate vitamin D supplementation during pregnancy may be helpful to prevent EOS in term neonates.

**PS-222** STAPHYLOCOCCUS CAPITIS IN NEONATAL LATE-ONSET SEPSIS: UNEXPECTED WORLDWIDE DISSEMINATION OF AN ENDEMIC MULTI-RESISTANT CLONE

1M Butin, 2P Martinis Simoes, 3H Lemtiss, 4S Lemtiss, 5R Vandenesch, 6O Claris, 7J-P Picard, 8P Raigade, 9F Laurent. 1Clinical Microbiology, Hospices Civils de Lyon, Lyon, France; 2Unité 1111 - CR1, Inserm, Lyon, France; 3Laboratoire de Recherche Et d’Analyses Médicales, Fraternité de La Gendarmerie Royale, Rabat, Morocco; 4NICU, Hospices Civils de Lyon, Lyon, France

10.1136/archdischild-2014-307384.521

**Background** Multi-resistant *Staphylococcus capitis* NRCS-A is involved in late-onset sepsis (LOS) in French NICUs.

**Aims** To investigate the geographical distribution of NRCS-A, and to precise its susceptibility profile.

**Methods** Twelve *S. capitis* isolates from distant NICUs (Australia, Belgium, France, United Kingdom, n = 3 each) and 2 *S. capitis* isolates from adult patients were analysed using PFGE, SCCmec typing, dru-typing, a MLST-like analysis, and antimicrobial susceptibility testing. To explore impact of vancomycin resistance, and vancomycin heteroresistance. These antimicrobial susceptibility profile including aminoglycosides and methicillin resistance, and vancomycin heteroresistance. These molecular and antimicrobial susceptibility profiles differed from those of adult isolates. An increase of vancomycin and daptomycin susceptibility profile after 15 daily subcultures with vancomycin, we determined vancomycin, daptomycin and linezolid minimal inhibitory concentrations (MICs).

**Results** All NICU *S. capitis* isolates harboured a type V-related SCCmec element, (ii) exhibited the same dru-type, (iv) formed a monophyletic group, (v) harboured a same antimicrobial susceptibility profile including aminoglycosides and methicillin resistance, and vancomycin heteroresistance. These molecular and antimicrobial susceptibility profiles differed from those of adult isolates. An increase of vancomycin and daptomycin (but not linezolid) MICs was observed, significantly faster (p < 0.05) for NRCS-A isolates than other tested strains.

**Conclusion** Our analysis demonstrates an unexpected worldwide distribution of *S. capitis* NRCS-A, specifically in NICUs. Recently, we collected complementary NICU isolates belonging to NRCS-A from Norway, Denmark, the Netherlands, USA, Brazil, New Zealand and Canada, confirming the worrisome dissemination of NRCS-A. Its multi-resistant profile and its ability to rapidly adapt to vancomycin selective pressure, constitute a selective advantage to NRCS-A in NICUs, and raise the issue of potential therapeutic failure and the need for alternative antimicrobial regimens.

**PS-223** IMPROVING STAFF COMPETENCE AND CONFIDENCE FOR NEONATAL RESUSCITATION, A QUALITY IMPROVEMENT INITIATIVE

S Hackett, M Cassidy, S Gormally. Neonatal Intensive Care Unit, Our Lady of Lourdes Hospital Drogheda Co. Louth, Drogheda, Ireland

10.1136/archdischild-2014-307384.522

**Aims** To introduce a Quality Improvement Initiative aimed at instilling confidence and competence with Neonatal Resuscitation in Labour Ward (LW) and Neonatal Unit (NICU) staff.

**Methods** A Neonatal Resuscitation Initiative Team (NRIT) consisted of LW and NICU midwives, an Advanced Nurse Practitioner (ANP) and a Paediatric Consultant. LW, NICU and paediatric staff were invited to attend a presentation to outline the aims and methodology of the initiative. Emphasis was placed on teamwork with effective leadership and communication. This was followed by a demonstration of low fidelity simulated neonatal resuscitations performed by the NRIT.

Midwifery and NICU staff were then invited to partake in a Simulated Team Response (STR) to 2 simulated resuscitations.

A random selection of participants completed a closed questionaire before and after the NRIT demonstration and before and after their STR. Levels of confidence in all aspects of neonatal resuscitation, including teamwork and leadership skills were evaluated using a Likert Scale.

**Results** One hundred and thirteen staff participated in the quality initiative from January 2013 to August 2013. Seventy four staff participated in the NRIT demonstrations and 39 in the STR. Forty three questionnaires were completed following the NRIT and 13 following the STR. Using a Wilcoxon test the post gain in confidence score was statistically significant (p = 0.0020) for doctors and midwives.

**Conclusion** Simulation training is a valuable means of maintaining skills and enhancing confidence for neonatal resuscitation. This study quantifies the positive impact of a Quality Improvement Initiative aimed at improving performance at neonatal resuscitation.

**PS-224** VIDEO EDUCATION TO IMPROVE BAG MASK VENTILATION DURING SIMULATED NEWBORN RESUSCITATION

1P Deindl, 2J Schwind, 3A Berge, 4G Schmoeller. 1Department of Neonatology and Pediatric Intensive Care Medicine, University Medical Center Hamburg-Eppendorf, Hamburg, Germany; 2Department of Pediatrics and Adolescent Medicine Division of Neonatology Pediatric Intensive Care and Neuropediatrics, Medical University of Vienna, Vienna, Austria; 3Department of Pediatrics and Adolescent Medicine Division of Neonatology Pediatric Intensive Care and Neuropediatrics, Royal Alexandra Hospital, Edmonton, Canada

10.1136/archdischild-2014-307384.523

**Aim** To evaluate if video based education could improve quality of positive pressure ventilation (PPV) performed by novice healthcare providers during neonatal resuscitation.

**Methods** Twenty-eight 4th year medical students were randomly paired and instructed to give PPV to a modified manikin as single-person resuscitators, then as two-person paired resuscitators using either an anatomical shaped neonatal face mask with an air cushion rim (IS) or a Laerdal round face mask (LM). After watching a video-tutorial they randomly repeated each mask ventilation performance. Airway pressure, gas flow, tidal volume, and mask leak were recorded. PPV performance quality was analysed using video recording.

**Results** Mask leak was lower during one-person ventilation when using IS (56 ± 16%) compared to LM (71 ± 19%). LM mask leak during one-person ventilation was significantly lower when using the two point top hold in contrast to the ok rim hold (before training: 63 ± 22% vs. 72 ± 18%, after training: 57 ± 17% vs. 77 ± 12%, respectively). Watching a video-tutorial improved correct head position (score: 1.4 ± 0.7 vs. 3.8 ±
Conclusion A self-instructional educational video on adequate bag mask ventilation significantly improves performance quality scores in novice health care providers.

Background Approximately 1% of newborns (NB) require advanced resuscitation (AR) [intubation (ET), and/or chest compression (CC) and/or medication (ME)] at birth. The NRP recommends checking risk factors maternal (MF), intrapartum (IF) and fetal (FF) before each birth (evidence level of expert recommendation) but the need for a team with advanced skills after risk factors have been identified remains undetermined. This imprecision leads to underprovision of expertise which is unsafe or costly overprovision of expertise.

Objective To evaluate the relationship of RF and the need for AR in NB ≥ 34 w gestational age (GA).

Design/methods Prospective, case-controlled study conducted in 16 sites (ARG, CHL, USA and BRA) during 18 months. DR management followed NRP guidelines. Eligible cases were NB ≥ 34 w GA receiving AR at birth and the 4 consecutive NB not requiring AR were selected as controls for the study. Exclusion criteria: prenatal diagnosis of major congenital malformations. Univariate analysis and multivariate logistic regression (MLR) were used to estimate OR and the associated 95% CI.

Results From 61,593 deliveries, 58,429 NB were ≥ 34w GA (95%). Out of 219 NB receiving AR (0.37%), 23 were excluded, resulting in 196 cases and 784 controls. We found 21 RF
