dysmorphic features, skeletal anomalies, goitre or pigmentation.

The rest of the examination was unrevealing.

Investigations showed normal CBC, ESR, and liver and renal and thyroid functions. Sweat chloride test, and tissue trans-glutaminase concentrations were normal. His IGF-1 level = 70 (IGF-1 SDS = -1) and his bone age = 3 years. The peak GH response to clonidine stimulation test = 10 ng/dl. Brain MRI showed normal pituitary gland.

Because of the decelerated growth and marginally low IGF-1 a trial of GH therapy was started (0.035 mg/kg/day s.c. HS). A rapid catch-up of growth occurred during the first 3 years of treatment that was maintained at a slower pace during the following 5 years. Testicular enlargement started at 11 years and at 12 years his HtSDS = 0.8 and bone age = 12.5 years. His predicted adult height = 181 cm.

Conclusion Prolonged GH treatment of this boy (normal GH–IGF-1 axis) with GH unexpectedly resulted in a HTSDS which surpassed his MPHtSDS by 1.4 SD.

PO-0074  PSEUDO-BARTTER’S SYNDROM AS A FIRST MANIFESTATION OF CYSTIC FIBROSIS IN INFANCY

5 Furtik, T Javorka, L Spirevska. Center for Cystic Fibrosis, University Children’s Hospital, Skopje, Macedonia

Background and aims Metabolic alkalosis in association with low serum electrolyte concentration (hyponatremia, hypochloremia, and hypokalemia) is known complication of cystic fibrosis (CF) in infancy. The condition is a metabolic mimicry of Bartter’s syndrome, therefore is sometimes referred to as pseudo-Bartter’s syndrome in CF. The aims of study were to estimate the prevalence of this metabolic disorder as a first manifestation of CF and the influence of some clinical and genetic factors on its developing.

Methods The records of all 85 newly diagnosed infants with CF in our region was 18.8%. Mean age of diagnosis was 16 infants had manifestations of hyponatremic/hypochloremic dehydration with metabolic alkalosis, therefore the syndrome were analysed.

Results 16 infants had manifestations of hyponatremic/hypochloremic dehydration with metabolic alkalosis, therefore the prevalence of pseudo-Bartter’s syndrome among newly diagnosed infants with CF in our region was 18.8%. Mean age of patients was 3.5 (range 1–8) months. Most of them were breastfed. Mean values of blood pH, serum bicarbonate, sodium, chloride and potassium (mmol/L) were: 7.57 ± 0.06, 44.89 ± 2.67, 117.87 ± 5.38, 67.06 ± 8.48, 2.69 ± 0.47, respectively.

Concerning CFTR genotypes of these patients, a great variability was observed for girls in Q2 for both MEHHP (p = 0.018) and DDE (p < 0.001) exposure. For MEHHP the difference with the quartile showing the smallest HC was 2 cm at 11 months of age, which was not statistically significant (HC Q2: 44.9, 95% CI 43.2–46.7; HC Q3: 42.9, 95% CI 42.2–43.5).

Conclusion For MECP, MEHHP, and DDE exposure over time, a higher HC was observed in low exposed children in a gender-specific way. Follow-up is warranted to see if associations persist into later childhood and are related to autism spectrum disorders.

PO-0076  PREVALENCE OF OVERWEIGHT AND OBESITY AMONG 5–6-YEAR-OLD CHILDREN IN NORTH PART OF SERBIA

5 Turucic, Department of Pediatrics, Local Health Center “Dr Milorad Mika Pavlović”, Indjija, Serbia

Background and aims Overweight and obesity among children became an important public health concern as their prevalence within the preschool population has been markedly increased in last decades. The aim of the present study was to examine and compare the prevalence of overweight and obesity among 5–6 year old children either sex in year 2003 and year 2013.

Methods Overweight and obesity were measured by body mass index (BMI). BMI 85–95th percentile was considered as overweight and BMI ≥ 95th percentile represents obesity. The study was performed in the total population of 859 nonelected 5–6 year old children (423 in 2003 and 436 in 2013) by retrospective analysis of their medical documentations.

Results The overall prevalence of overweight in 2003 was 9.63%, whereas the prevalence of obesity was 9.46%. However, 10 years later, in 2013, the prevalence of overweight was significantly higher (15.6%) as well as the prevalence of obesity (13.3%). Prevalence of overweight and obesity among...
