Background and aims Compared with term infants, late preterm infants have higher risks for morbidities such as respiratory distress, hypothermia, hypoglycemia, hyperbilirubinemia and feeding difficulty. The aim of this study to investigate incidence and clinical characteristics of feeding difficulty in late preterm infants.

Methods A total of 426 infants were enrolled. We evaluated the clinical and demographic characteristics and feeding difficulty of late preterm infants.

Results 54 infants had feeding difficulty. There were no differences in gestational age and birth weight among the groups. Mean intolerance day was 2.3 ± 1.2 days. Compared infants with feeding intolerance and non-feeding intolerance full enteral feeding time 8 ± 2.3 days and 5.2 ± 1.7 days, respectively (p < 0.001). Feeding with breast milk rates was similar between the groups. Prokinetic use in the feeding intolerance group was 46% (n = 25). Subgroup analysis between prokinetic users and non-users there were no differences in full enteral feeding time and duration of parenteral nutrition.

Conclusions Late preterm infants should be followed closely for the complications such as feeding difficulty.

PO-0583 IS THERE AN ASSOCIATION BETWEEN FUNCTIONAL GASTROINTESTINAL DISORDERS IN THE FIRST THREE MONTHS OF LIFE AND MATERNAL PSYCHOLOGICAL PROBLEMS?

Diagnostica Per Immagini- U. O. Medicina Nucleare Policlinico, University of Bari, Bari, Italy

Aim of the study To investigate whether functional gastrointestinal disorders (DFGs), defined according to Rome III criteria, are associated with postpartum mood disorders.

Methods 113 mother/child pairs were enrolled in this perspective, longitudinal study. Maternal depressive symptoms were evaluated at birth, one and three months after delivery using Maternity Blues, Edinburgh Postpartum Depression Score (EPDS) and Symptom Check List for Anxiety and Depression. The Adult Attachment Interview (AAI) was used to determine the attachment style of the mother. Any sign/symptom was recorded weekly for the first three months of life, together with type of feeding. Statistical analysis (SPSS software): χ² test, student t-test, linear regression.

Results 37 (32,7%) newborns were exclusively BF. 16 (14,2%) newborns had regurgitation, 10 (9,7%) colics, 4 (3,5%) dischizia and 10 (9,7%) constipation. 60 (53,1%) mothers had postpartum depression and/or anxiety. 53,6% of infants with regurgitations had a depressed mother vs 23% of infants without regurgitations (χ² = 10,63, p = 0.003); 45,2% of infants with colics had a depressed mother vs 15,9% of infants without colics (χ² = 10,63, p = 0.001). A woman’s insecure attachment style was found in 36% of infants with persistence of regurgitations until third months of life vs 1,8% of infants with mother’s secure attachment style (p < 0.001).

Conclusion Postpartum maternal depressive symptoms and anxiety are associated with infantile colic and regurgitations. Screening and early intervention in cases of postpartum depression could be useful to avoid inappropriate nutritional and pharmacologic treatments, promoting the health of both mother and infant.
