FEEDING DIFFICULTY IN LATE PRETERM INFANTS

However, it has been suggested that neonates exposed to hypoxic injury are at increased risk of developing necrotizing enterocolitis (NEC) and so feeds should be withheld until rewarming. A national survey was performed to gain insight into current approaches towards enteral feeding during therapeutic cooling.

Methods

Hospitals were contacted by telephone and asked standardised questions about nutritional practice during cooling. 42 of the 47 units to provide cooling in the UK supplied information.

Results

67% of hospitals had no guidelines or had guidelines that failed to provide information with regards to starting enteral feeds during cooling.

79% do not give enteral nutrition during cooling. Of these, 24% of guidelines cited risk of NEC/GI complications as justification. 70% offered no reasoning for the recommendation.

In these units, 43% began patients on TPN (± lipids), while 55% provide only IV fluids.

No units give full enteral nutrition, however 21% of units provide trophic feeds, preferentially using expressed breast milk most frequently at a rate of 1 mL 1 h⁻¹, with supplemental IV fluids and no adjunctive TPN.

Conclusion

This survey concludes that there is no uniform approach to nutrition during therapeutic cooling in neonates within the UK.

Further research and subsequent guideline development is essential to ensure optimal treatment is given to this patient group.

PO-0582 FEEDING DIFFICULTY IN LATE PRETERM INFANTS

Led by 4K Arakel, 4G Kadoglu Smeket, 1E Alyazm Ezdar, 8F Sari, 4G Kannaz Kutman, 3FE Campolat, 3S Ozgu, 1N Urs, 3U Dilmen. Neonatology, Zekai Tahir Burak Maternity Teaching Hospital, Ankara, Turkey; 3Neonatology, Yildirim Beyazit University School of Medicine, Ankara, Turkey

Background and aims

Compared with term infants, late preterm infants have higher risks for morbidities such as respiratory distress, hypothermia, hypoglycemia, hyperbilirubinemia and feeding difficulty. The aim of this study to investigate incidence and clinical characteristics of feeding difficulty in late preterm infants.

Methods

A total of 426 infants were enrolled. We evaluated the clinical and demographic characteristics and feeding difficulty of late preterm infants.

Results

34 infants had feeding difficulty. There were no differences in gestational age and birth weight among the groups. Mean intolerance day was 2.3 ± 1.2 days. Compared infants with feeding intolerance and non-feeding intolerance full enteral feeding time 8 ± 2.3 days and 5.2 ± 1.7 days, respectively (p < 0.001). Feeding with breast milk rates was similar between the groups. Prokinetic use in the feeding intolerance group was 46% (n = 25). Subgroup analysis between prokinetic users and non-users there were no differences in full enteral feeding time and duration of parenteral nutrition.

Conclusions

Late preterm infants should be followed closely for the complications such as feeding difficulty.

PO-0583 IS THERE AN ASSOCIATION BETWEEN FUNCTIONAL GASTROINTESTINAL DISORDERS IN THE FIRST THREE MONTHS OF LIFE AND MATERNAL PSYCHOLOGICAL PROBLEMS?

1ME Baldassarre, 2G Castoro, 3A Fanelli, 8R Maurogiovanni, 8A Nesta, 8S Amoroso, 1R Casisba, 1N Laforta. Department of “Scienze Biomediche ed Oncologia Umana”-Neonatology and NICU Section, University of Bari, Bari, Italy; 2Istituto di Scienze della Formazione Psicologica Comunicazione, University of Bari, Bari, Italy; 3Istituto Interdisciplinare di Medicina Sez. Diagnostica Per Immagini- U. O. Medicina Nucleare Polichirico, University of Bari, Bari, Italy

Aim of the study

To investigate whether functional gastrointestinal disorders (DFGs), defined according to Rome III criteria, are associated with postpartum mood disorders.

Methods

113 mother/child pairs were enrolled in this perspective, longitudinal study. Maternal depressive symptoms were evaluated at birth, one and three months after delivery using Maternity Blues, Edinburgh Postpartum Depression Score (EPDS) and Symptom Check List for Anxiety and Depression. The Adult Attachment Interview (AAI) was used to determine the attachment style of the mother. Any signs/symptoms was recorded weekly for the first three months of life, together with type of feeding. Statistical analysis (SPSS software): χ² test, student t-test, linear regression.

Results

37 (32,7%) newborns were exclusively BF. 16 (14,2%) newborns had regurgitation, 10 (9,7%) colics, 4 (3,5%) diathesia and 10 (9,7%) constipation. 60 (53,1%) mothers had postpartum depression and/or anxiety. 53,6% of infants with regurgitations had a depressed mother vs 23% of infants without regurgitations (χ² = 10,63, p = 0.003); 45,2% of infants with colics had a depressed mother vs 13,9% of infants without colic (χ² = 10,63, p = 0.001). A mother’s insecure attachment style was found in 36% of infants with persistence of regurgitations until third months of life vs 1,8% of infants with mother’s secure attachment style (p < 0.001).

Conclusion

Postpartum maternal depressive symptoms and anxiety are associated with infantile colic and regurgitations. Screening and early intervention in cases of postpartum depression could be useful to avoid inappropriate nutritional and pharmacologic treatments, promoting the health of both mother and infant.

PO-0584 WITHDRAWN

PO-0585 EFFECT OF LONG TIME LOW TEMPERATURE PASTEURISATION (LTLT) AND LYOPHILIZATION ON FATS OF HUMAN MILK BANKING (HMB)

1DL Lamirande, 4C Vayssie, 1L Couvelo, 1P Perez, 4C Billeaud. Lactarium Bordeaux-Marmande, CHU Bordeaux, Bordeaux, France; 3TERG, Université de Bordeaux, Bordeaux, France; 3UMR ISPED CHU Bordeaux, Bordeaux, France; 4CIC Pédiatrice Neonatologie and Nutrition, CHU Bordeaux, Bordeaux, France

10.1136/archdischild-2014-307384.1225

Aim

To determine the effect of long time low temperature pasteurisation (LTLT) and lyophilization on fatty acid composition and oxidative stability of human milk banked at 2–4°C for prolonged periods.

Methods

Human milk samples were lyophilized and stored at 2–4°C. Fatty acid composition was measured by gas chromatography.

Results

Fatty acid composition of human milk was not significantly affected by LTLT and lyophilization. Oxidative stability assessed by low temperature rancidity test and peroxide value was not significantly affected by LTLT and lyophilization.

Conclusion

LTLT and lyophilization of human milk banked at 2–4°C for prolonged periods is safe and does not significantly affect fatty acid composition or oxidative stability.
