Covering 10 years of the highest. As in many subjects, giving the importance to sexual education in this period has many benefits regarding development. This descriptive study was carried out in order to determine knowledge levels and attitudes of doctors and nurses regarding children’s sexual development and sex education.

Methods

The design of the study is descriptive. The study was conducted with doctors and nurses who work at various clinics of two state hospitals located in the Istanbul province. A total of 138 doctors and 150 nurses work at these hospitals.

Results

It was determined that the majority of cases were female and were aged more than 36 years. 63.3% of the cases have bachelor’s degrees and 62.1% were medical doctors. It was determined that the number of correct responses given by the cases regarding some behaviours observed in children aged 12 years.

Introduction

Parents whose child is admitted in a hospital are often overwhelmed by an oncoming discharge. Especially when care has to be continued at home, parents instructions are provided only shortly before discharge. As a result discharge may be suboptimal or hospitalisation may be prolonged. The question arises whether family centred care contributes to a more effective and efficient discharge management.

Method

We studied the literature, organised 4 focus group discussions with 21 nurses in total, and distributed a survey among 15 parent couples.

Results

Results from several studies show that parents’ participation shortens the length of stay in hospital. However, the present discharge procedure is not sufficient family centred and oncoming discharge is not discussed timely. We recommend to discuss discharge planning on a daily basis within the team of care providers including the parents, and to involve parents in the discharge management.
Background Research shows that palliative care for children requires special attention and a coordinated approach to support the child and its entire family. In June 2012 a project was started in the Women’s and Children’s Clinic, Academic Medical Centre, Amsterdam, the Netherlands.

The aim of this project is to give a child with a life-threatening or life limiting illness the highest possible quality of life and to relieve parents from all coordination tasks.

Methods We developed a multi-disciplinary team of professionals, called the Emma Home Team (EHT), to support families with a child in the palliative phase. A case manager (a paediatric nurse) visits the family at home and coordinates the care in collaboration with parents and professionals to provide a unique situation for each family.

When the treatment period has finished the case manager evaluates the care with the parents and professionals involved.

Results In the last 18 months over 90 families were supported by the EHT. In 32 cases the care is finished and evaluated. These evaluations all show the importance of the coordinating function of the case manager. Parents who were supported by the EHT indicated that the commitment, expertise and accessibility of the team were a great support for them.

Conclusion The interventions by the EHT seem to have an important added value for children and families in the palliative phase. A next step is to see if this way of caregiving can be used in other hospitals.

**Background and aims** The aim of this study was to determine the thoughts of adolescent pregnant/mothers about motherhood.

**Methods** A descriptive qualitative approach was used in the study. The data were obtained from 41 adolescent pregnant/mothers with a questionnaire and open-ended semi-structured interviews in-depth audio-taped method. Data were analysed through thematic analysis by researchers.

**Results** Over the total amount of sample; 80.5% of adolescents didn’t use a family planning method, 24.4% are relatives with her husband, 68.3% were being pregnant willingly and 24.4% didn’t receive antenatal care regularly. The theme of study determined on four topics;

1) The feelings when she learn her pregnancy
2) The meaning of baby/child in her life
3) The effect of pregnancy for her future plans
4) The troubles about care of baby/child

They mentioned hearing about their pregnancy, the first feelings were fear, sadness, wonder, happiness, shocked, rebelled and thought it wasn’t the right time.

“I really surprised and feared because being a mother seemed difficult for me. Because of economical obstacle I thought that could we support the babies’care expenditure.”

“I got married when I was 18. Everyone began to ask whether I am pregnant in first month period of my marriage. After three months I got pregnant. I felt that I had to be pregnant”

“I felt sadness, really a big sadness, cry too much, because my husband had left the house just before the news of pregnancy.”

**Conclusion** Although pregnancy is gratifying process for a woman, it can also become uncomfortable situation for adolescents.
